---

Dear Dr Roseth and Ms Sussex,

Thank you for your time today at the public hearing Engadine.

Going last allowed me to hear the important submissions of others, but meant that I was more rushed than I had hope, especially in relation to the subject site.

I was unaware that the site was mentioned in the Mayoral Minute nevertheless, we made detailed submissions, 26 April 2013, and we note that the staff recommended an FSR of 2.5:1

To quote the staff report:

"The site's corner location and combined area (1255m<sup>2</sup>) provides opportunities to maximise FSR that would not be possible on most mid block sites within the centre. It is considered that an FSR of 2.5:1 can be realised within a six (6) storey building form wrapping around the corner.

It is recommended that 2-14 Station Street, Engadine be given an increased maximum FSR of 2.5:1 and a reduced building height to 20m. The amendment will require re-exhibition. A reduced building height of 20m (6/7 storeys) is recommended for all buildings throughout the commercial centre (as recommended above). Development should incorporate a recessed sixth floor level whilst maintaining an FSR of 2:1. "

I would be pleased if you could carefully consider the attachments which were also provided in hardcopy today.

I was asked by Dr Roseth, why the subject site should get more HOB and FSR than others in the centre.

I wish to clarify why:

The site is among the best positioned Transit Oriented Development (TOD) sites in the Sutherland Shire - 5m from lift access and covered access to Engadine Railway Station. This should be given significant weight in your consideration of the final HOB and FSR. Sites should receive more (or less) HOB and FSR having full regard to all their attributes. Blanket HOB and FSR across any centre is not appropriate as some sites can sustain more than others. Those that are true TOD sites should maximise HOB and FSR in the public interest to leverage the public investment in heavy rail services and meet regional planning objectives promoting TOD as the highest and best use for such sites.

A HOB 30m and FSR 3:1, as requested, will not have any adverse environmental impacts upon any other site or the public domain. I have attached a Sketch-up drawing file (a 3D model of the immediate locality and Station Street North). This can be viewed by downloading the free software - Download SketchUp | SketchUp. The justification for lowering the HOB to 20m in Engadine without a more detailed site by site assessment does not do the strategic planning process justice.

Council's professional planners have already differentiated the subject site from others in Engadine as worthy of more FSR due to its corner location, large consolidated lot size and consolidated ownership. The site deserves more HOB and FSR and there should be further incentives where development accesses the site from Preston Lane at the rear. Further the adjoining site (old council library site) should receive incentive to provide that accessibility as well.

In the context of the Sydney Regional and Southern-Subregional planning objectives and for the sake of

consistency with other equivalent Town Centres, the site at HOB 20m and FSR 2.5:1 is well below that assigned to other equivalent LEP. The most recent example is the Minister's gazettal of Ashfield Local Environmental Plan 2013 on 10 January 2014 which provides HOB 23m plus bonus HOB incentive and FSR 3:1. See maps 0150\_COM\_HOB\_001\_010\_20130902 (414 kB) and 0150\_COM\_FSR\_001\_010\_20130902 (432 kB). Ashfield is a smaller Town Centre and less well serviced centre than Engadine. Please also refer to the comparison table in our submission "LP-03-252376 - LEP Submission - 2-14 Station Street, Engadine" dated 26 April 2013 (pages 16-18).

A very good discussion of barriers to TOD can be found in Burke, M., Li, T. and Dodson, J. (2011) Planned Spatial Restructuring of Australian Cities: Are the transport benefits of employment decentralisation policies greater than those of transit-oriented development? State of Australian Cities, Melbourne. Consistent with Burke and Dodson (2011) resistance to increased densities remains the predominant barrier and Engadine is highly unlikely to see any benefits from employment decentralisation aimed at Sydney's west ([http://soac.fbe.unsw.edu.au/2011/papers/SOAC2011\\_0082\\_final.pdf](http://soac.fbe.unsw.edu.au/2011/papers/SOAC2011_0082_final.pdf)).

Thank you for hearing our submissions and for your detailed consideration.

Regards

Brett

14 January 2014

Dr John Roseth and Ms Meredith Sussex  
Joint Chair - Public Hearings  
Sutherland LEP Review,  
NSW Department of Planning and Infrastructure

(by online submission)

Attention: Ms Marian Pate, DoPI

Dear Ms Pate,

**Re: Draft Sutherland LEP 2013 - LP/03/252376**

**Property: 2-14 Station Street, Engadine**

This is a formal submission under section 57(6) of the *Environmental Planning and Assessment Act 1979* (the Act) on behalf of the Stainer Family who own the subject site.

There is a pressing need for more transit oriented development (TOD) and a great choice of housing types in Engadine, leveraging accessibility to Engadine Railway Station and this is a matter of *public interest*<sup>1</sup> identified by Council's Housing Strategy. TOD sites form an integral part of the urban renewal of centres, building on the strengths of each place, transforming under-used or dilapidated areas, boosting local economies and providing a mix of uses and activities, which meet the needs of the community.

Whilst balancing the public interest against private interests may be an issue in some of the strategic planning options being reviewed by the public hearing into the Draft LEP, there is no doubt that the pressing need to meet demand for additional residential and mixed use development close to railway stations (TOD) is a critical objective for the Engadine Town Centre and Sutherland Council's Housing Strategy, as it is across the Sydney Region.

There are very few sites in Sydney and the Sutherland Shire that have such direct access to a railway stations such as this site does to Engadine Station. This LEP review needs to have significant regard to leveraging this accessibility.

This submission seeks a modest increase in HOB and FSR and submits that this is in the broad public interest. The site can at appropriate HOB and FSR support Council's adopted housing strategy. In relation to this site, increased height and density can be achieved without any adverse urban design outcomes, environmental harm or amenity impacts upon neighbours because of the site's location, orientation and topographical position. DCP controls can require a maximum street façade height and require setbacks at the upper levels to address urban form outcome objectives, SEPP 65 aims and an appropriate balance between HOB and FSR as proposed will better achieve objectives.

Within the attached submission dated 26 April there is detailed 3D shadow analysis demonstrating that overshadowing falls upon the Princes Highway to the south.

---

<sup>1</sup> *Double Bay Marina v Woollahra Council [2009] NSWLEC 1001* - planning principle: discerning the public interest

This submission supports the B3 zone for Engadine Town Centre but seeks that an increased HOB (30m) and FSR (3:1) be assigned to the subject site, consistent with other centres zoned B3 (see the comparison in the LEP submission to Council dated 26 April 2013 attached), to achieve job and dwelling targets consistent with good town planning and urban design practice.

In addition to the submission dated 26 April 2013 it is submitted that incentives should be included in the LEP to procure an extension of Preston Lane to service Lots 3,4 and 5 in DP 23060. These incentives in relation to Lots 1 & 2 in DP 23060 may give an appropriate FSR and HOB bonus if Preston Lane is extended to service the site eliminating driveway access to the site from the Princes Highway or if Lots 1 & 2 in DP 23060 form part of a consolidated development of the subject site.

This site has been recommended by staff to have an FSR of 2.5:1 with a HOB of 20m. This results in an underutilisation of the site in our submission. The site's juxtaposition to Engadine Railway Station must be carefully considered. This is a TOD site and it should receive further consideration for increased HOB and FSR, giving significant weight to its accessibility to Engadine Railway Station.

If the proposed FSR (2.5:1 as proposed by Council's planners) is retained, HOB should be increased to 25m to retain a smaller footprint and narrower built form outcome consistent with SEPP 65. The Draft LEP has provided relatively consistent ratios between HOB and FSR, i.e. 2:1 at 20m, 3:1 at 30m such that 2.5:1 should be at 25m if the staff's recommended 2.5:1 FSR is retained.

To be clear, this site can sustain HOB 30m at 3:1 with no adverse, urban form, environmental or amenity impacts at all. The site is 5m walking distance from the pedestrian access (including disabled access) to Engadine Railway Station. It is our opinion that it is in the public interest to promote this site as a unique TOD site capable of providing highly accessible and wider housing choice to future occupants within a mixed-use development. Further this can be achieved with no adverse impacts.

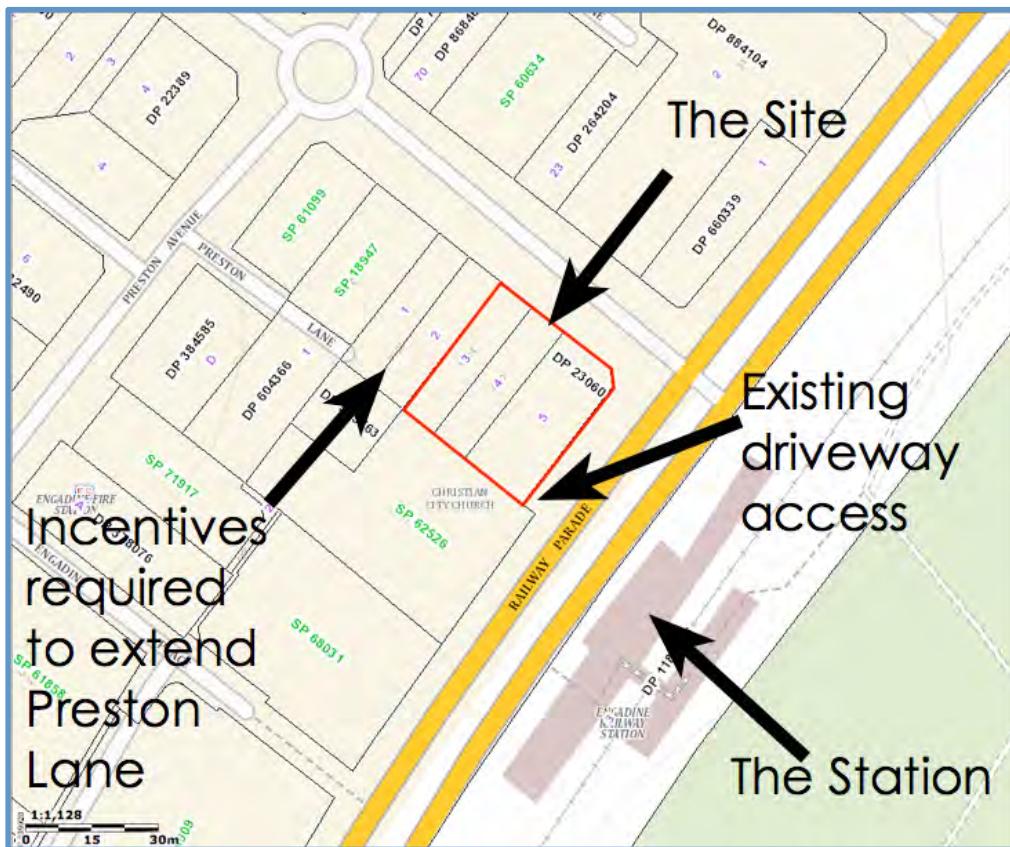

## **The Site**

The site is No.2 to No.14 Station Street, Engadine as outline in red in Figure 1 - The Site No.2 to No.14 Station Street, Engadine.

The site is the nexus and important focal point of heavy rail access (Engadine Station) at the Princes Highway (Railway Parade) and Station Street, Engadine. The Station Street frontage provides a bus interchange with service to the greater Engadine area (Heathcote, Lotus, Woronora Heights) as well as to Miranda.

The site is at the crest of the hill with extensive views available from any moderately elevated position.

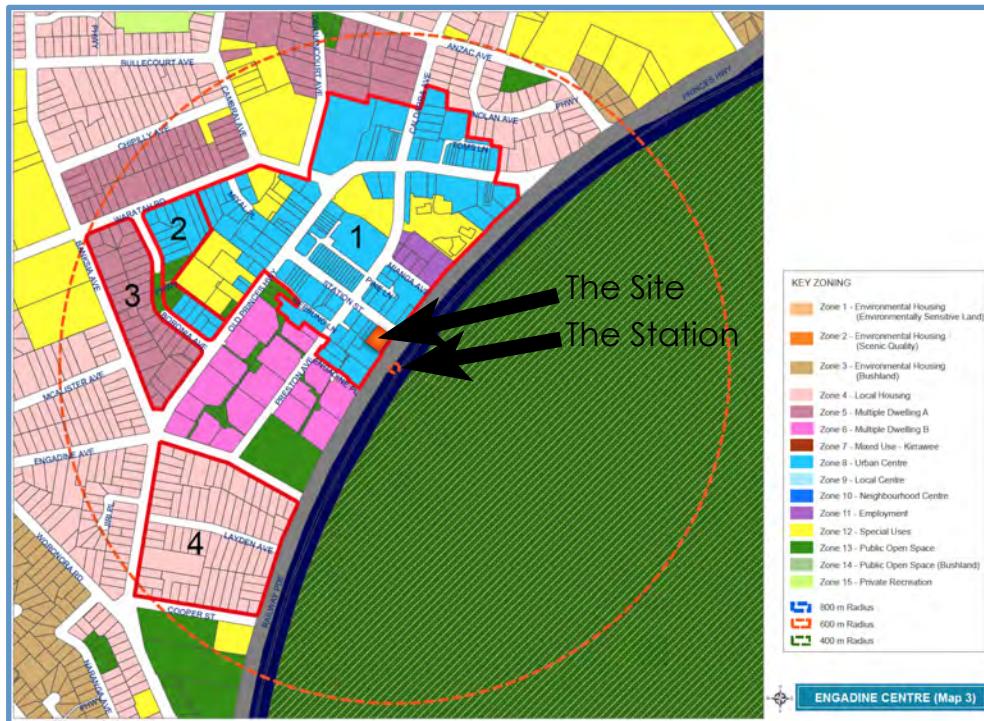

Vehicular access is from the Princes Highway. For safety reasons the site should be made accessible from Preston Lane rather than the Princes Highway (see Figure 1).

**Figure 1 - The Site No.2 to No.14 Station Street, Engadine**

#### Proximity to Engadine Railway Station

The site has immediate and direct lift access and pedestrian tunnel access to Engadine Railway Station. The site is a prime site for higher density transit oriented development.

**Figure 2 - 600mm Radius - Council Housing Strategy**

## **Vehicular Access**

There is a need to provide the site with vehicular access from Preston Lane rather than from the Princes Highway. The current owners have received advice from Council that no vehicular access will be permitted from Station Street, that the existing access from the Princes Highway is considered dangerous and the Council's preference for any redevelopment of the site is to procure vehicular access from the rear via Preston Lane.

This can be achieved by providing Lots 1 & 2 in DP23060 with LEP incentives to amalgamate with the site or with incentive to dedicate land for the purpose of public road extension of Preston Lane to the boundary of Lot 3 in DP2306.

There exists within the Draft LEP precedence for bonus HOB and FSR on the basis of securing access to sites whilst removing access from classified roads where existing or proposed vehicular crossings are considered undesirable or will not be permitted by the RMS or Council (see clause 4.3(7) and clause 4.4(3) of the Draft LEP).

Lots 1 & 2 in DP23060 are in single ownership as are Lots 3, 4 & 5 in DP 23060.

We recommend that the best approach is to provide LEP incentives for both options such that the landowners can determine the best way forward, whether as individual or consolidated development sites, with the clear objective being to remove vehicular access from the Princes Highway to Lots 3, 4 & 5 in DP 23060 and provide it across the rear of Lots 1 & 2 in DP23060.

It is clearly in the public interest to remove the existing vehicular access off the Princes Highway and provide access to the site from Preston Lane.

## **Economics**

Council's Housing Strategy report noted that council's own residential aged care facility at Engadine community centre was increased in height from 4 to 6 storeys primarily because the future commercial operator found that it would not be financially feasible at 4 storeys.

The Housing Strategy states that under the current zoning there is little opportunity for further development of flats in Engadine. It states that more opportunities are needed to be provided for smaller households in order for the ageing population to down size with Engadine having a very significant quantum of aging population.

The Housing Strategy notes that the centre benefits from good accessibility due to the proximity of the railways station as well as to the Princes Highway and Heathcote Road but the LEP then fails to create increased height and density to promote urban renewal.

The Housing Strategy states that there has been limited development in recent years but then seeks to retain the existing 2:1 FSR and at a lower (20m HOB) than originally exhibited HOB of 25m.

The economic realities are that at the existing FSR 2:1 the internal rates of return have been inadequate to promote significant urban renewal.

There is a legitimate argument that height and density, particularly close to Engadine Railway Station should increase to deliver Council's adopted housing strategy and

profoundly, to encourage transit oriented development (TOD) by assigning the most significant HOB and FSR increases to sites within 200m of Engadine Railway Station.

### Social Planning

Sutherland Shire Draft Housing Strategy 2031 as detailed by DAP025-13 dated 12/11/2012 states with respect to Engadine:

*“The centre is surpassed only by Miranda and Caringbah in the numbers of supermarkets, banks and the range of services provided.”*

In a social planning sense, as well as a town planning sense, the once village of Engadine is by Council's own strategic planning strategy more equivalent to and is more appropriately classified as a town centre. It is our opinion that any review of the Draft South Subregional Strategy would reasonably give Engadine this classification.

Sutherland Shire Draft Housing Strategy 2031 and Council's publication “Ageing well: Housing” dated 24/05/2013 clearly support the need for more housing for smaller households and in particular identify a pressing need for more aged care facilities.

To quote Council's strategic planning report:

“The percentage of population aged 65 and over was 13.3% in 2006 and it has risen to 14.9% in 2011, an increase of 1.6%.”

The Ageing Strategy was well received by the community and well regarded across local government. Specific commitments made by council through the adoption of its Ageing Strategy in relation to housing include:

- Increase housing choice by increasing permissible building heights and densities in centres with proximity to transport, shopping and facilities;
- Increase aged housing by increasing permissible building heights and densities for aged persons housing in centres with proximity to transport, shopping and facilities;
- Provide incentives for villa developments; and
- Promote dual occupancy as a viable and cost effective form of aged housing.

Engadine town centre should proceed on the basis of Council's commitments made through the adoption of its Ageing Strategy.

### Public hearing submission

The approach the draft LEP has taken to Engadine has been to assign two blanket or broad combinations of HOB and FSR development standards to the town centre with low density elsewhere.

The town centre's core was originally exhibited at HOB 25m but has been now recommended by staff to be HOB 20m and is proposed to remain unchanged at FSR 2:1 (with the exception of the subject site which is proposed to be 2.5:1) and the western fringe of the town centre has been given HOB 20m and a lower FSR 1.5:1.

Engadine is not a Village it is a town centre by the nature of the strategic planning now proposed. Applying 2:1 and 20m is conservative when compared to other equivalent town centres in the Sutherland Shire and greater Sydney region. It is also inappropriate in some

locations as we'll (i.e. the northern side of station street should not overshadow the public domain and vibrant footpath environment on the south side of Station Street.

As much as standard instrument LEP may seek to standardise, standardising HOB and FSR across a whole town centre does not work. A good town plan should create articulation in height and density mindful of the subdivision patterns, precincts, topography, orientation and other site attributes such as solar access, shadowing and accessibility to public transport.

This blanket approach has ignored street orientation, site orientation and topography among other relevant considerations. There is no discernible cohesive vision for Engadine Town Centre that has sought to identify sites that can accommodate additional heights and densities or those that cannot deliver such heights or densities, without adverse amenity impacts afflicting the public domain or reducing the development potential of adjoining sites.

A more comprehensive urban morphology analysis, urban form and economic feasibility strategy would have identified key sites, consolidation requirements, access requirements and a wider range of HOB and FSR necessary to achieve desirable urban renewal of this town centre. This work should have included a draft DCP exhibited in tandem so that more refined public consultation could occur including setback development controls.

It is acknowledged that Council's attention has been drawn predominantly to other centres and locations including those sites impacted by the mayoral minute. The lack attention given to Engadine is self evident. It has not been a focal point of the strategic planning effort.

There has been a negative reaction to the HOB and FSR proposed for Engadine by some and it is our submission based upon our own block modelling that in relation to some sites 20m HOB and 2:1 FSR is probably excessive as it may have adverse amenity impacts upon the public domain. However, the Draft LEP presents a missed opportunity to significantly increase the height and density of other sites where the site attributes support HOB and FSR increase above 20m and 2:1 respectively.

One such site where height and density can leverage its street orientation, site orientation, topography and juxtaposition to the railway station is the subject site.

This is self evident in that it is the only site recommended to be given additional FSR on the basis on the submission made to Council 26 April 2013. Council staff have recommended 0.5:1 additional FSR, but held the HOB down to 20m despite the exhibited LEP proposing 25m.

This submission seeks that the public hearing review support an FSR of 3:1 and a HOB of 30m for the subject site.

In addition to previous submissions to Council, and in order to promote safer vehicular access to the subject site from Preston Lane at the rear (eliminating dangerous vehicular access off the Princes Highway), this submission proposes incentives for the adjoining site (Lots 1 & 2 in DP23060) to provide that access.

The incentives for the adjoining site should be to allow an increase to HOB 25m with an FSR of 2.5:1, as a transition to the HOB 20m and FSR 2:1 further west on the south side of Station Street, subject to the dedication of and extension of Preston Lane or the incorporation Lots 1 to 5 inclusive within DP23060 as a consolidated development site.

Setting aside our submission that there should have been a far more detailed urban form study supported by an economic feasibility study for the Engadine Town Centre, it is our submission that 2-14 Station Street, by Council's own acknowledgement is a unique site.

The subject site is a rare Transit Oriented Development site immediately adjoining a railway station that should receive further special consideration through this public hearing process.

It is noted that at this date there have been no public submission specifically against the proposal to increase the HOB and FSR of the subject site.

Public submissions have been broadly opposed to any increase in HOB or FSR across Engadine Town Centre citing traffic and parking issues. The whole purpose of promoting TOD development sites is to reduce dependence upon vehicles and promote public transport use.

A failure to promote the site as a TOD site as well as eliminate vehicular access from the Princes Highway by providing greater incentives through HOB and FSR bonuses for all 5 lots in DP23060 would be a missed opportunity to realise the full development potential of such a unique site.

## **Summary**

The attached submission dated 26 April 2013 provides more detailed analysis that justifies the submission that appropriate development standards are FSR 3:1 and HOB 30m.

Council at its meeting of 30 September 2013 resolved (Mayoral Minute No. 15/13-14) to 'request the Minister for Planning and Infrastructure to direct the Planning and Assessment Commission to conduct a public hearing in accordance with Section 57 of the Environmental Planning and Assessment Act, 1979 into the content of Draft Sutherland Shire Local Environmental Plan 2013'.

We note that this site is not among any of the sites considered controversial nor is it contained or referenced by Mayoral Minute No.6/13-14 dated 29 July 2013. The site is not subject to any direct public objections because the HOB and FSR supported by this submission it will not cause any adverse environmental effects. In fact at FSR 3:1 and HOB 30m it will better achieve broader planning aims and objectives promoting transit-oriented development.

Those submissions recorded against the increased HOB and FSR in Engadine that emotively seek to compare the Draft LEP's proposed densities for Engadine to Hurstville and Rockdale are ill-considered.

Hurstville's Draft City Centre LEP proposed a maximum FSR of 9:1 and HOB of 60m with one tower already completed at 60m and the Planning Assessment Commission considering an increase of 3 storeys to an approved tower at 60m.

Rockdale's LEP as gazetted provides a maximum FSR of 4:1 and HOB of 51m.

The maximum FSR & HOB in the Draft LEP are:

- 4:1 at 40m at Sutherland (including TOD sites along the old Princes Highway)
- 3.5:1 at 40m at Caringbah (including TOD sites)
- 3:1 at 46m at Caringbah (including TOD sites)

- 3:1 at 30m at Cronulla (including TOD sites)
- 3.5:1 at 30m at Miranda ((including TOD sites)
- 2:1 at 50m at Kirrawee (The Brick Pit)

It is worthy of noting that the above Draft development standard are all assigned to sites within 600m radius of railway stations.

Allowing the subject site, a TOD site, at Engadine, at FSR 3:1 at HOB 30m is consistent with the hierarchy evident in the draft LEP.

As stated by Council “*The [Engadine] centre is surpassed only by Miranda and Caringbah in the numbers of supermarkets, banks and the range of services provided.*” That is, Engadine Centre has the core commercial and social services required to support increased residential density demands.

It is our submission that the public hearing report should recommend that the subject site be provided with a HOB of 30m and an FSR of 3:1, subject that any Draft DCP addresses the need for the upper levels to be setback such that the façade height not be viewed as greater than 25m from footpath levels. The adjoining lots 1 & 2 in DP23060 should be incentivised to provide an extension of Preston Lane or to form part of a consolidated site and transition to the lower HOB and FSR further west in Station Street.

On behalf of the owners of the subject site it is submitted that the public hearing report should recommend that:

1. Lots 3, 4 & 5 in DP 23060 be provided with a maximum HOB of 30m and FSR of 3:1, subject that the DCP addresses the need for the upper levels to be setback such that the façade height not exceed 25m from footpath levels.
2. Lots 1 & 2 in DP23060 receive a HOB 25m and FSR to 2.5:1, if Lots 1 & 2 in DP23060 are amalgamated with Lots 3, 4 & 5 in DP 23060 as a single development site or Lots 1 & 2 in DP23060 dedicate land as public road to extend Preston Lane to provide vehicular access to Lots 3, 4 & 5 in DP 23060 other than from the Princes Highway.

In the alternative, if FSR is retained as proposed by Council’s planners at 2.5:1 HOB should be increased to 25m to create a taller building on the corner and narrow more SEPP 65 compliant outcome.

I have created a 3 dimensional model in Sketchup® format that I am happy to share with the DoPI if it will assist any analysis for the Engadine Centre.

Please don't hesitate to contact me on 0408 463 714 or by email [brett@daintry.com.au](mailto:brett@daintry.com.au).

Yours faithfully,

Brett Daintry, MPIA, MAIBS, MEHA  
Director

## **Attachments**

1. LP-03-252376 - LEP Submission - 2-14 Station Street, Engadine dated 26 April 2013
2. Council Report - 31\_Engadine\_Centre post exhibition of Draft LEP
3. Council Housing Strategy 7 November 2012

## Station Street, Engadine Shadows Winter Solstice @ Various HOB and Times

This analysis demonstrates that 2-14 Station Street (HOB 30m - building depth 18m) will at 9am shadows the roof the commercial building to its south with the commercial neighbour to the south already shadowing the RFB further south at 9am. By 10am the shadows that would be cast upon neighbours fail solely upon the commercial neighbours existing roof. By 11am the shadows swing over the Princes Highway and by 1pm predominantly upon the road with no additional impacts at HOB 30m. The same can be said of a taller building at 1 Station Street.

Shadowing caused by 8m, 13m, 16m, 20m and 25m HOB have been modeled on the northern side of Station Street. These demonstrate that even at relatively low HOB 13m morning sunlight up to 11:00am would be lost to the existing footpath coffee shops and restaurants. At HOB 16m the footpath areas would not receive full sun at ground level until 12:45pm. At HOB 20m the footpath areas would not receive full sun until 1:35pm. At HOB 25m the footpath areas would not receive full sun at ground level until 2:18m (leaving 42min of quality sunlight at ground level. Allowing for 3 hours (9am to 3pm) of full solar access maximum HOB for block edge buildings should not exceed approximately 13m in these locations. The LEP adopts 20m with upper level setbacks.

This analysis demonstrates that a blanket HOB of 20m and FSR of 2:1 is not appropriate. Depending upon public domain impacts HOB up to 30m will be acceptable for some sites whilst lower HOB and more detailed setback controls will be required to protect the amenity of the public domain. The conclusion is that the depth of analysis reasonably required to set HOB and FSR in Engadine does not support the blanket HOB and FSR adopted. Some sites deserve more HOB and FSR and others, will because of unsatisfactory impacts, deserve less.

**9am**

**Lower HOB and FSR should be located northern side of main roads**

## **31. Engadine Centre**

**12 submissions were received concerning the proposed scale of development and the loss of village character in Engadine Centre.**

### **Summary of Issues**

The community response to the implications of draft 2013 Local Environmental Plan for Engadine highlight a range of both positive and negative issues. The main issues raised relate to traffic, parking, overshadowing and impacts on the amenity of the centre.

Several submissions were received in relation to the inadequate levels of existing commuter parking, traffic demand created by Woronora Heights residential commuters at peak times and the traffic and parking demand that will be created by new development. Residents consider that traffic commute times have already been raised, without the impact of additional dwellings.

Car parking concerns were specifically raised in relation to the potential for 7-8 storeys of apartments above shop top housing. Submissions considered that existing car parking provision close to shops is deficient; parking and traffic flow through Engadine have not been considered; and that car parking and traffic issues affect commuters from Engadine to the Sydney CBD.

There is strong objection to the proposed increases in density, with comparisons being made to Rockdale and Hurstville. Submissions assert that high rise units are not desired by elderly residents and that the majority of elderly people in this area prefer to live in villa type housing or retirement villages that are well serviced by local community transport. They also claim that the two large developments currently under construction within the Town Centre are out of scale.

Concerns were raised regarding height limit increases above 3 storeys, particularly in such close proximity to the Royal National Park and surrounding bushland, leading to a potential loss in character of the area and the ‘village’ feel. Tree preservation is highlighted as a key means of maintaining this ‘village feel’ within Engadine. Fear that the preservation of trees is difficult, if not impossible as a result of development was also expressed.

One submission raised the perceived relationship between higher density living and increased crime.

**Engadine Town Centre Aerial 2012**

The following site specific issues were raised:

- 2-14 Station Street, Engadine
- Waratah Road – Boronia Avenue and Cambrai Avenue
- Myal Place Car park
- 18-26 Waratah Road, Engadine

### **Analysis of Issues**

Engadine is a district shopping centre with a large residential catchment, good public transport, strong retail base, schools, open space, community facilities and other services. It is an ideal location to provide housing choice and is a location in demand by many groups.

Between 2006 and 2011, Engadine experienced an increase in single person households of mainly older people. It also saw an increase in the number of young children and families, as young families established themselves in the area. At the same time, there is demand from the Shire's ageing population for villas and accessible flats within walking distance to local services and amenities. It should be noted that while there is a clear demand for villas, the market is simply not providing

new villas. Land is too valuable for redevelopment at a single storey scale. New units may not meet the needs of all people looking to downsize but lifts allow residents easy access and created a low maintenance dwelling where a person can live on a single level. For those who can no longer cope with the demands of an old dwelling on a large garden, units allow people to downsize but stay in their local community.

The draft plan seeks to promote the development of new, quality apartments in Engadine. This will assist in the revitalisation of the centre. The draft plan increases the maximum building height to allow the existing floor space ratios to be realised and to improve feasibility and design options for new development in the centre.

The strategy for the centre is also to strengthen its retail function by providing good pedestrian connectivity and amenity while maintaining good solar access to public spaces. A further aim is to build on the character of Engadine as a suburb in close proximity to bushland, by increasing the amount of landscaping throughout the centre.

Engadine Centre is considered to be a centre where additional building height can be accommodated. However, there has been significant community concern that the 25m (7-8 storey) height proposed in the centre is excessive. Many were concerned that increased heights would reduce the village feel of the centre, whilst another submission requested increased heights along the Princes Highway.

### Changing Character

Consistent with the Sutherland Shire Housing Strategy 2013, Engadine Centre is proposed to support additional housing opportunities and increased height and density because it is well serviced by shops and services and public transport. A change in character for the centre is expected, given the retail centre zone encompassed in the strategy. It is understood that the increased development will ultimately lead to a more urban feel in the centre.

Submissions comparing Engadine with developments approved in Caringbah, Rockdale and Hurstville are noted. Hurstville proposes FSRs of 7:1, 6:1, 5:1 in centre, and 4.5:1 in surrounds. Similarly the FSRs in Caringbah are up to 4:1. The scale of development proposed in Engadine Centre (FSR of 2:1) is considerably more modest.

### Height

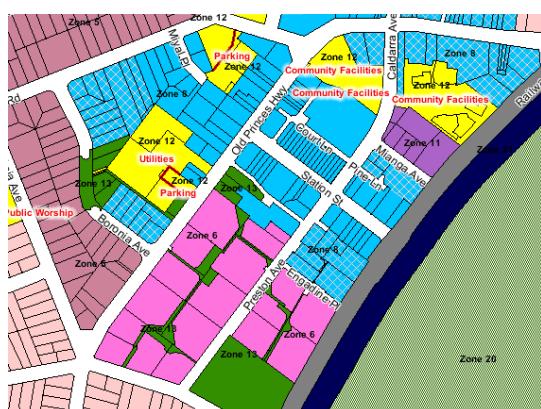

In developing the draft controls for Engadine, input was sought from Sutherland Council's Architectural Review Panel (ARAP). The panel expressed concerns about height and bulk, particularly in locations visible from Princess Highway and the Illawarra Railway. The centre's role in providing a transition between the natural

environment of The Royal National Park and the built environment of Sutherland Shire is seen as being particularly important.

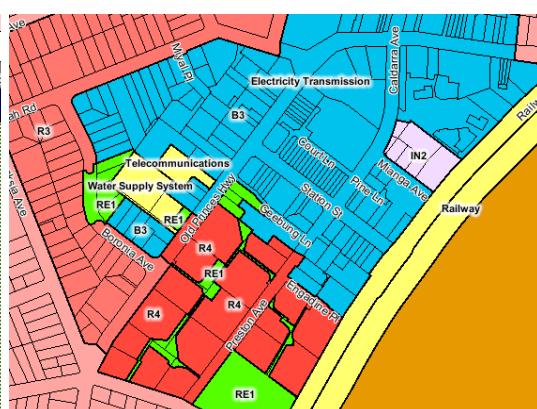

The current proposed controls (draft SSLEP 2013) increase maximum building heights throughout the core of the centre to a maximum of 25m. An increase in height in excess of this would not be in keeping with the strategy / character adopted for this centre. The submission's vision to create a prominent gate way building on Princess Highway is not consistent with the strategy (more modest building forms providing a transition with the adjoining national parks) for the centre. It is also noted that the potential remains to further reduce the scale of the centre and provide a better transition with the national park whilst maintaining the currently proposed FSR (2:1).

It is recommended that the height within the centre zone be reduced to 20m, this reduction in height would allow a building of six stories to be provided whilst still allowing the proposed FSR of 2:1 to be realised. Consideration should also be given to recessing the upper level of all building forms to allow only the lower five storeys to be visible at street level.

It is considered that a 20m height more accurately reflects the height of mature trees found in the locality. Given the location of the Engadine Centre to the adjoining National Park and the rationale for a transition built form for this centre and surrounds, there appears sufficient reasoning to reduce the proposed SSLEP2013 building heights from 25m (7-8 storey) to 20m (6/7 storey with the top floor being setback to read as 5 storey from street level). This will help to maintain the pedestrian scale of the centre.

SSLEP2006

Draft SSLEP2013

### General Traffic and Parking Issues

The availability of car parking and traffic congestion are the major issues of concern in all centres. Whilst development must provide car parking on site in accordance

with Development Control Plan provisions, it is recognised that additional dwellings will exacerbate the problems particularly if car ownership and use continues to rise.

The extent to which congestion is attributed to new development is often overestimated by the community. It is the community's perception that a recent increase in development has created the increased demand for car parking and subsequent increased traffic on the road network. Yet over the last ten years, there has not been a significant increase in the Shire's population. Increased car parking demand and traffic levels are more likely attributed to increased vehicle ownership, particularly because household vehicle ownership in the Shire has increased at greater rate than the population growth. Shire residents are more affluent (compared to Sydney SD) and more residents can afford to own and run a second car. Furthermore more affluent residents make multiple trips to purchase products, and pursue the more recent growth in recreation/ leisure activities and personal services.

It is acknowledged that traffic issues will continue to be a fact of life in the Shire. Adjustments will be made to the road network and/or intersections over time which will marginally improve traffic conditions. It is evident that the demand for car parking and car transport is largely insatiable.

#### Tree preservation

Submitters were concerned about tree loss. Council has recently introduced a tree replacement policy requirement of 4 to 1, when a significant site tree is removed. Where tree replacement is unable to be accommodated on site, an applicant has an ability to enter into an agreement with Council where replacement trees are re-planted in more suitable locations at the Applicants cost.

#### Increased Crime

Submitters were concerned about a potential increase in crime. Crime prevention design considerations are reviewed at Development Application stage in accordance with the 'Safer by Design' guidelines.

#### **Response to Issues**

Sutherland Shire Council recognises the importance in maintaining the character and form of local town centres and the intrinsic role that these centres play in fostering a sense of belonging and community. In response to submissions received it is recommended that building height be reduced to 20m to help to maintain the pedestrian scale of the centre.

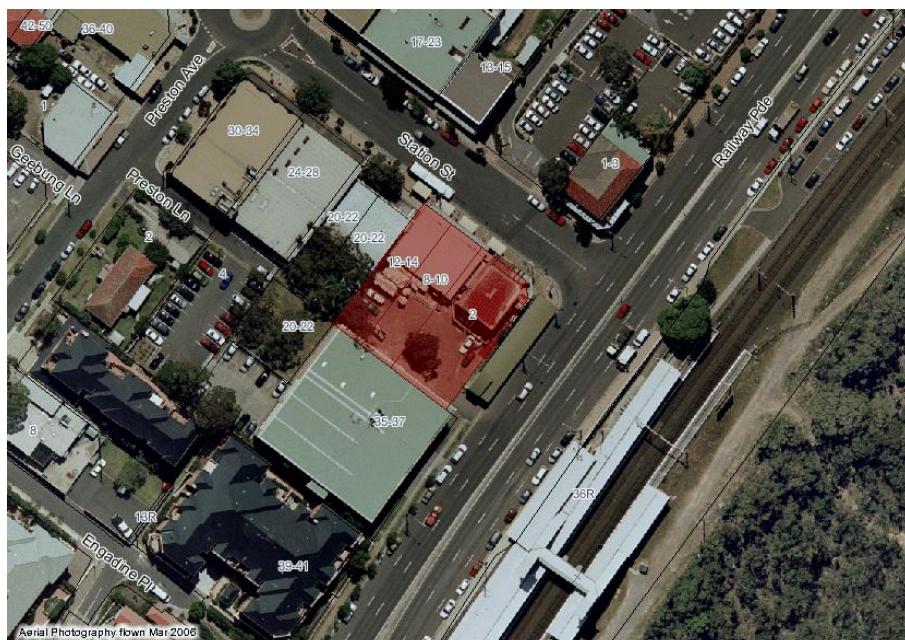

## **Specific Sites**

### **2-14 Station Street, Engadine**

**1 submission received in response to 2-14 Station Street, Engadine.**

#### **Summary of Issues**

The submission proposes an increase in both FSR and height to that identified in Sutherland Shire Draft LEP 2013. Controls in the draft SSLEP 2013 propose an FSR of 2:1 and a height limit of 25m. The submission by Dainty Associates requests an FSR of 3:1 and a height of 30m.

**Aerial image - 12-14 Station Street, Engadine**

In broad terms, the submission outlines that a building form of greater height and mass can be accommodated on the subject site without significantly impacting upon the amenity of existing and adjoining buildings or streets. Whilst also providing a level of amenity compliant with the requirements of SEPP 65 - Residential Flat Buildings for future buildings on the subject site.

#### **Analysis of issues**

It is agreed that a building of greater height and mass could be physically accommodated on the subject site; however consideration must also be given to the intended character of the centre and particularly its relationship to the surrounding Royal National Park.

## Height

In developing the draft controls for Engadine input was sought from Sutherland Council's Architectural Review Panel (ARAP). The panel expressed concerns relating to creating buildings of excessive height and bulk, particularly in locations visible from Princess Highway and the Illawarra Railway. The Centre's role in providing a transition between the natural environment of The Royal National Park and the built environment of Sutherland Shire is seen as being particularly important.

The exhibited controls (draft SSLEP 2013) increase maximum building heights throughout the core of the centre to a maximum of 25m. An increase in height in excess of this would not be in keeping with the strategy / character adopted for this centre. The submission's vision to create a prominent gate way building on Princess Highway is not consistent with the strategy (more modest building forms providing a transition with the adjoining national parks) for the centre.

It is also noted that there is potential to further reduce the scale of the centre and provide a better transition with the national park whilst maintaining the currently proposed FSR (2:1)

It is recommended that the height of this site and all others within the centre zone be reduced to 20m. This reduction in height would allow a building of six (6) storeys to be provided whilst still allowing the proposed FSR of 2:1 to be realised. Consideration should also be given to recessing the upper level of all building forms to allow only the lower five (5) storeys to be visible at street level.

## Floor space ratio

The site's corner location and combined area ( $1255\text{m}^2$ ) provides opportunities to maximise FSR that would not be possible on most mid block sites within the centre. It is considered that an FSR of 2.5:1 can be realised within a six (6) storey building form wrapping around the corner.

It is recommended that 2-14 Station Street, Engadine be given an increased maximum FSR of 2.5:1 and a reduced building height to 20m. The amendment will require re-exhibition. A reduced building height of 20m (6/7 storeys) is recommended for all buildings throughout the commercial centre (as recommended above). Development should incorporate a recessed sixth floor level whilst maintaining an FSR of 2:1.

A reduction in height through the centre to 20m would provide a more sensitive transition between the built and natural environment, whilst still allowing the proposed density of 2:1 to be accommodated.

The subject site's corner location enables it to accommodate a slightly larger FSR of 2.5:1 within the recommended 20m height limit.

### **Response to issues**

It is recommended that 2-14 Station Street, Engadine be given an increased maximum FSR of 2.5:1 and a reduced building height to 20m.

### **18-26 Waratah Road, Engadine**

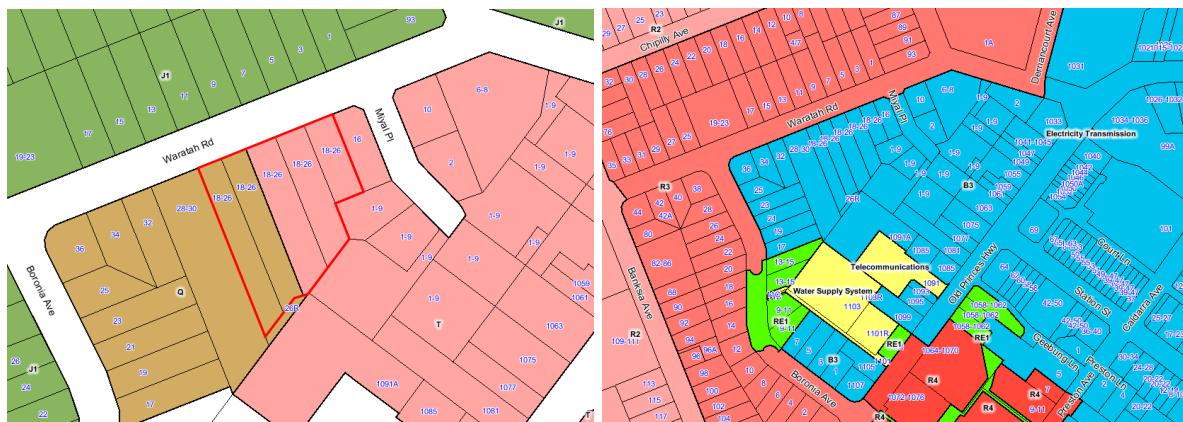

#### **Submission received in response to 18-26 Waratah Road, Engadine**

### **Summary of Issues**

The Coles site at 18-26 Waratah Road, Engadine has a split height of between 20m and 25m. The submission requests an increase to the allowable building height in the commercial centre of Engadine up to 25m (7-8 storeys).

**Aerial Photo - 18-26 Waratah Road, Engadine**

**SSLEP2013 Height of Buildings map T (pink) = 25m, Q (buff) =20m SSLEP2013 zoning**

## Analysis of Issues

It is acknowledged that the Coles site at 18-26 Waratah Road, Engadine has a split height of between 20m and 25m. The site at has been subject of an urban design and building shadow study and demonstrates that additional building height can be accommodated in the centre. Given the location of the Engadine Centre to the adjoining National Park and the rationale for a transitional built form for this centre and surrounds, there appears sufficient reasoning to reduce the proposed SSLEP2013 building heights from 25m (7-8 storeys) to 20m (6 storeys), with the top floor being setback to read as 5 storeys from street level.

## Response to Issues

The request to increase the height of this site to 25m is not supported. It is recommended that all heights in the centre be reduced to 20m.

### 1-9 Miyal Place Carpark

#### **1 submission received in response to 1-9 Miyal Place (Carpark)**

## Summary of Issues

The car park at the end of Miyal Place, Engadine (Lot 4 DP 50581) was transferred to Council in 1977 (DA889/77).The site is currently zoned Special Uses – Zone 12 and is classified as ‘community land’. Draft SSLEP2013 proposes to rezone this as B3 Commercial Core. The submitter supports the rezoning, but requests that the site remain as community land, as it provides some of the parking required for the adjacent Coles supermarket.

## Analysis of Issues

Council has already reclassified its car parks as operational land, including this land. Council has however, repeatedly given undertakings that public parking would be fully replaced when any public car park is incorporated into a future development proposal.

## Response to Issues

No change.

### **1 – 17 Waratah Road and 87 – 93 Cambrai Avenue**

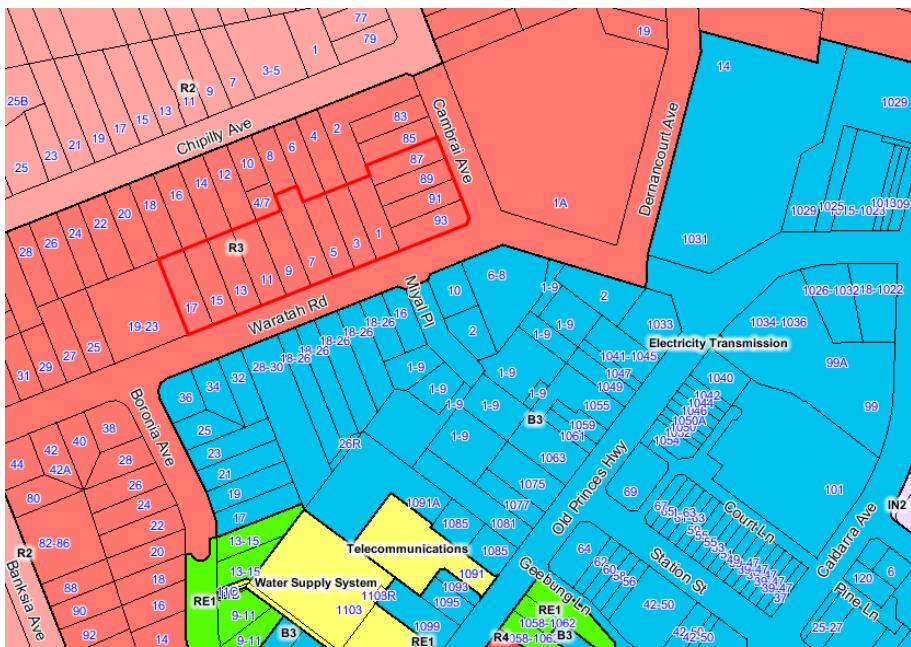

**1 submission received in response to 1 – 17 Waratah Road and 87 – 93 Cambrai Avenue.**

## Summary of Issues

The submission requests that lands at 87 – 93 Cambrai Avenue, Engadine and 1 – 17 Waratah Road, Engadine be rezoned to R4 High Density Residential.

**Aerial Image -1 – 17 Waratah Road and 87 – 93 Cambrai Avenue**

**Draft SSLEP2013 - Zoning Map**

## Analysis of Issues

The submission supports a rezoning of this site based on opposite sites having a proposed B3 Commercial Core zone and a proposed building height of 20m to 25m. The submission reasons that this zoning provides a transition between the commercial land fronting Waratah Road and the residential land fronting Chipilly Avenue. It also would provide further opportunity for multi unit dwellings in the residential areas surrounding the commercial precinct.

The subject properties are currently designated as Zone 5 - Multiple Dwelling A under SSLEP2006. The draft SSLEP2013 proposes an R3 – Medium Density zoning. There is merit in the requested R4 High Density zoning for this locality given the proximity of these sites to the proposed B3 Commercial Core and access to public transport and town centre facilities. However, rezoning of this western town centre precinct for the purposes of residential flat buildings (proposed R4 High Density Residential) was not supported by Council.

Council is aware that the existing residential flat zones in Engadine are fully developed and has explored the potential to increase the R4 Residential High Density zone. However, it has concluded that the most appropriate way to meet future housing needs at this point in time is to encourage redevelopment in the core commercial area.

## Response to Issues

It is recommended that there be no change to the draft plan.

## Sutherland Shire LEP 2013 - Submission

## 1 Executive Summary

This is a formal submission under section 57(3) of the *Environmental Planning and Assessment Act 1979* (the Act). No request is made under section 57(5) of the Act.

It is submitted that the amendments of the Draft LEP 2013, as sought by this submission, are minor and required to better meet the Sydney Regional, Sub-regional and draft LEP 2013 aims and objectives. This submission does not trigger any need for further public consultation under section 57 of the Act as there are no additional environmental or amenity impacts arising from the amendments sought.

Council should proceed under section 58 of the Act and seek determination that further community consultation is not required under section 58(3) of the Act, consequential to adoption of this submission in the final Council resolution to make the LEP 2013.

This submission supports the B3 zone for Engadine Town Centre but seeks that an increased HOB (30m) and FSR (3:1) be assigned to the subject site, consistent with other centres zoned B3, to achieve job and dwelling targets with consistent with good town planning and urban design practice. Please refer to Part 6 of this submission "Comparision to other B3 Town Centres".

Having proper regard for the subject site's prominent corner "gateway" location, its proximity (unmatched accessibility to public and private transport), its physical ability to support higher height and density with no adverse amenity impacts upon neighbours or public domain, and ability to full comply with SEPP 65 and the RFDC this submission should be supported.

A key strategy is to improve the use of public transport in Sydney by placing the highest buildings with the highest densities within 200m of heavy railway stations.

This site is within 5m of the Engadine Railway Station's entry with lift and subway access.

The site has immediate access to the Princes Highway and the bus interchange on its door step as well as being located with a Town Centre serviced by a wide range of retail and commercial services within short walking distances. It is within 100m walking distance of the Royal National Park, open space fields and the Town Square.

There are no equivalent sites in the Sutherland Shire that are located within walking distance and accessibility to all these facilities and attributes.

This site due to its commercial neighbour (south-west), topography and orientation, even at HOB and FSR well in excess of what this submission proposes, will not have any adverse privacy, overshadowing, loss of views or other amenity impacts upon its neighbours. This submission only seeks a modest increase but Council may having considered this submission allow more significant increased density and height without any additional impacts.

The existing large commercial building to the south-west of the site has a greater impact upon residential RFB further south-west and the bulk of the overshadowing

will fall upon the Princes Highway (see Part 9 of this submission “Shadow Analysis”).

At the HOB 30m and FSR 3:1 as proposed by this submission, development of the site is easily capable of full compliance with SEPP 65 and the RFDC. Block modeling incorporated in this submission assume a block edge outcome and a maximum 18m building depth to reinforce the corner and gateway nature of the site.

Zone B3 is identified by the exhibited material as:

“The B3 Commercial Core zone applies to the larger town centres, including Sutherland, Miranda, Caringbah, Cronulla, and Menai town centres and the Southgate Shopping Centre. This zone provides for extensive commercial and high-density residential development, in proximity to public transport.

The B3 zone is fundamentally different from B2 Local Centres and increased HOB and FSR for Engadine’s Commercial Core is appropriate.

Engadine is well placed to assist Sutherland Shire Council in meeting job and dwelling targets and this site is the most accessible site in Engadine, if not one of the most accessible in the Sutherland Shire.

Engadine is not proposed to be a B2 zone. B2 zones are proposed to be held to a maximum HOB of 20m or FSR 2:1 by the Draft LEP. Whilst the Draft LEP proposes a height of 25m, it then proposes an FSR of 2:1 at HOB 25m. The 2:1 maximum FSR is adopted by the Draft LEP for the lower intensity and density B2 zones. All other B3 zones adopt a wider range (higher) HOB and (higher) FSR as detailed by the analysis in this submission. Engadine should be treated the same as other B3 zones where sites support higher FSR.

There is a fundamental problem between the HOB 25m and the FSR 2:1 proposed. This is inconsistent with the larger range of higher HOB and FSR applied in other B3 zones. Engadine and specifically the subject site should be treated in a similar manner to the other B3 zones in terms of providing a range of HOB and FSR varying the built form outcomes. Council should promote higher HOB and FSR where sites can deliver higher levels of accessibility and good amenity outcomes for neighbours and occupants.

In basic terms, there has been little thought put towards the identification of appropriate key corner and gateway sites and the application of HOB and FSR consistent with the creation of strong corner site buildings defining the entries and exits to Engadine’s Commercial Centre, a well accepted urban design principle.

Further, little thought has been given in the Draft LEP to sites that can deliver higher HOB and FSR with better amenity outcomes and high accessibility to public transport, such as the subject site.

Engadine has been effectively “off the radar”. Caringbah, Cronulla and Sutherland, have proper published centre strategies, where as Engadine does not, yet the draft LEP B3 zone is to be applied. This is unfortunate as Engadine Town Centre needs a more detailed strategic vision taking account of site specific constraints and benefits.

The subject site is a prominent corner gateway site. It has a historically strong presence being at the entry to Engadine Railway Station and Station Street defining the main public transport entry for commuters utilising heavy rail and bus interchange facilities immediately adjoining the site on the boundary of the SP2 zones to the east.

It is this submissions opinion that the sites at No.2 to No.14 Station Street, Engadine inclusive, held in single ownership, should be:

- Zoned B3 consistent with the draft exhibited LEP.
- HOB 30m (U) reinforcing this important “corner and gateway” site within 5m of the entry to Engadine Railway Station and Station Street.
- FSR 3:1 (V) reinforcing an appropriate relationship between HOB & FSR consistent with other B3 zones (see Comparison to other B3 Town Centres) to ensure that this corner is reinforced by a strong block edge building addressing the entry to Engadine Railway Station and Station Street defining the main public transport entry for commuters utilising heavy rail and bus interchange facilities immediately adjoining the site on the boundary of the SP2 zones to the east.

The Draft LEP provides numerous examples within other B3 town centres where the HOB and FSR are equivalent to or larger than that sought by this submission.

The owners are only seeking HOB 30m as this will permit more sustainable development by compliance with the 25m effective height requirements for building provisions within the National Construction Code (previously known as the Building Code of Australia) and better achieve SEPP 65 and RFDC outcomes. Once a building exceeds 25m effective height under the BCA (NCC), measured from the top most habitable floor level to the exit level at the footpath, the next step required to make development economically viable is HOB 40m and FSR 4:1.

## 2 Locality

Engadine has been classified as a village in the South Subregion of Sydney, under the Metropolitan Strategy, see Figure 1 - Locality (Source: NSW Metropolitan South Subregional Strategy).

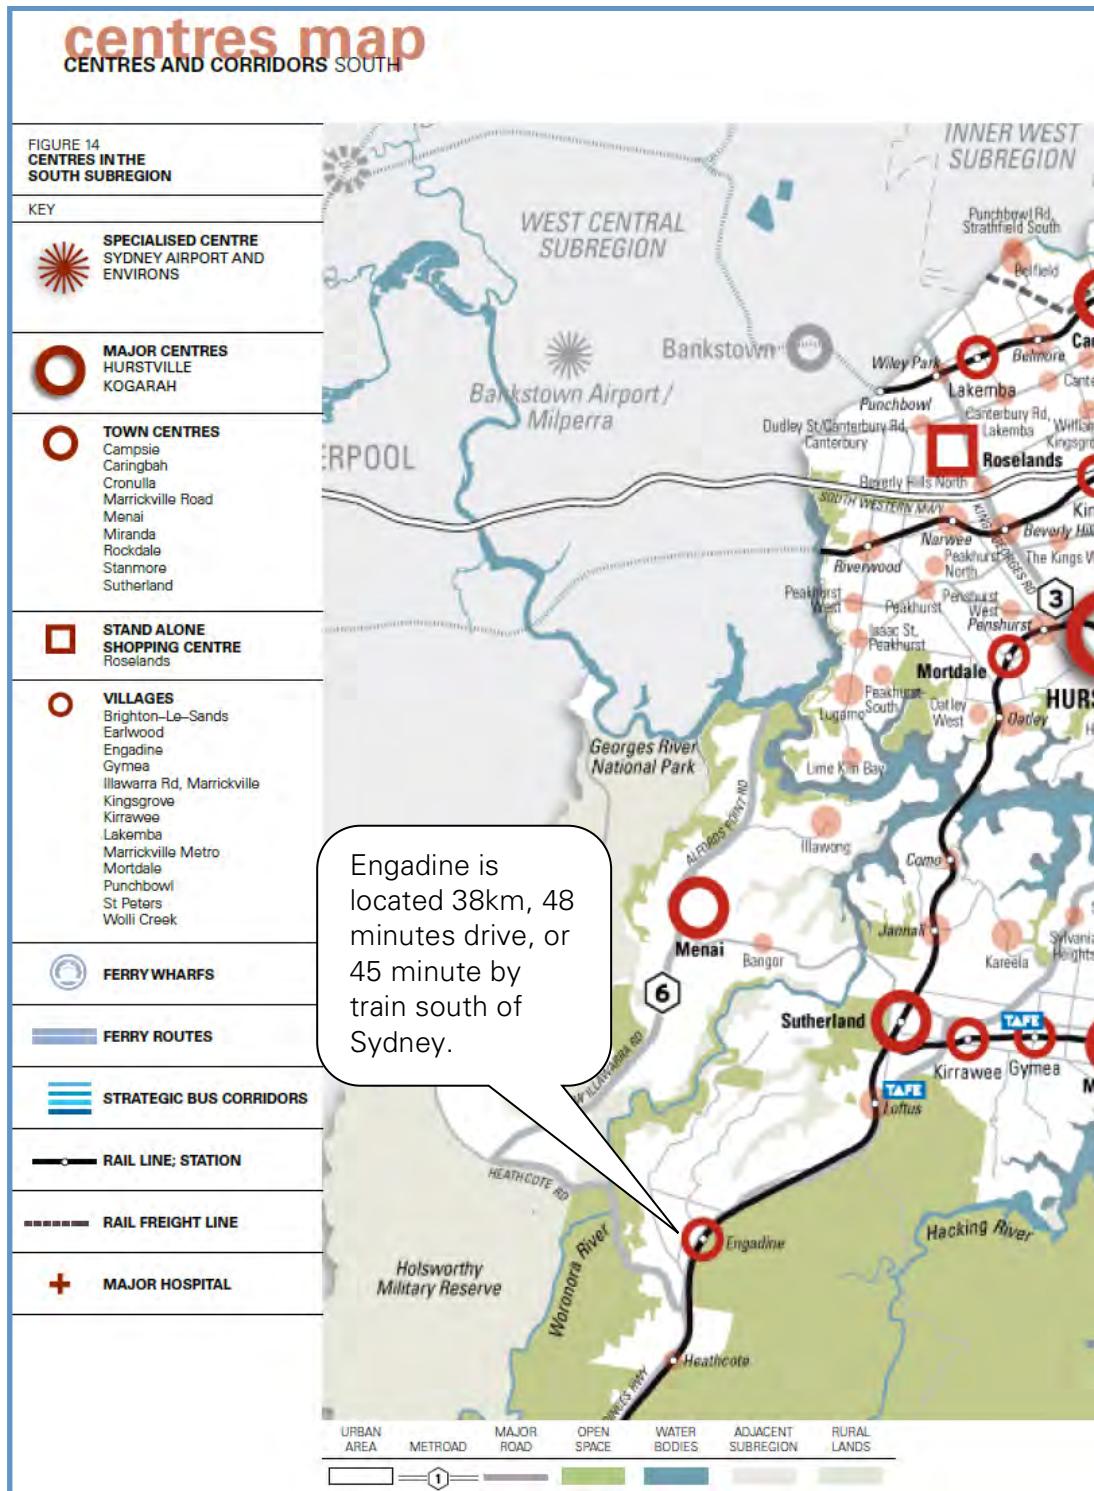

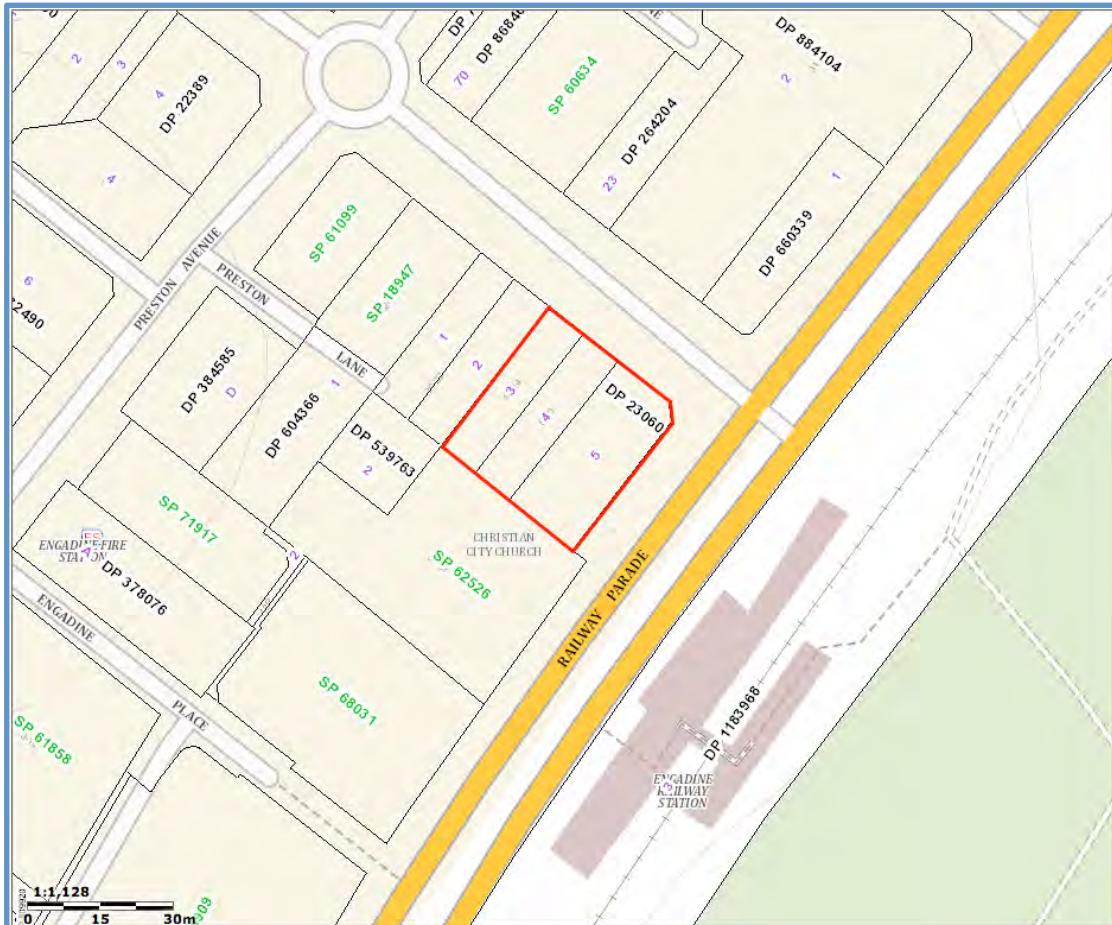

Figure 1 - Locality (Source: NSW Metropolitan South Subregional Strategy)

### 3 The Site

The site is No.2 to No.14 Station Street, Engadine as outline in red in Figure 2 - The Site No.2 to No.14 Station Street, Engadine.

The site is the nexus and important focal point of heavy rail access at the Princes Highway (Railway Parade) and Station Street. The site is at the crest of the hill with extensive views available from any moderately elevated position.

**Figure 2 - The Site No.2 to No.14 Station Street, Engadine**

#### 3.1 Site Ownership

The site is owned by Sydney William Stainer and Dianne Stainer as joint owners.

Ownership patterns are a relevant strategic planning consideration as fragmented ownership is an impediment to urban renewal.

The site is consolidated under single ownership by the Stainer family. There are no consolidation impediments to the development of the site. The owners wish to retain and expand a long standing family business at the site upon redevelopment which has and will continue to provide employment for 6 staff and more with expansion.

### 3.2 Real Property Description

The site consists of 3 lots with a total site area of 1,255m<sup>2</sup>:

1. Lot 3 in DP23060 – Area 335m<sup>2</sup>
2. Lot 4 in DP23060 – Area 335m<sup>2</sup>
3. Lot 5 in DP23060 - – Area 585m<sup>2</sup>

The site RL vary from 184.75 (east corner) to RL188.25 (west corner), a 3.5m cross fall west to east. The frontage to Station Street has a fall of 1.43m towards the Princes Highway (Railway Parade). The frontage to the Princes Highway as a fall of 1m towards Station Street.

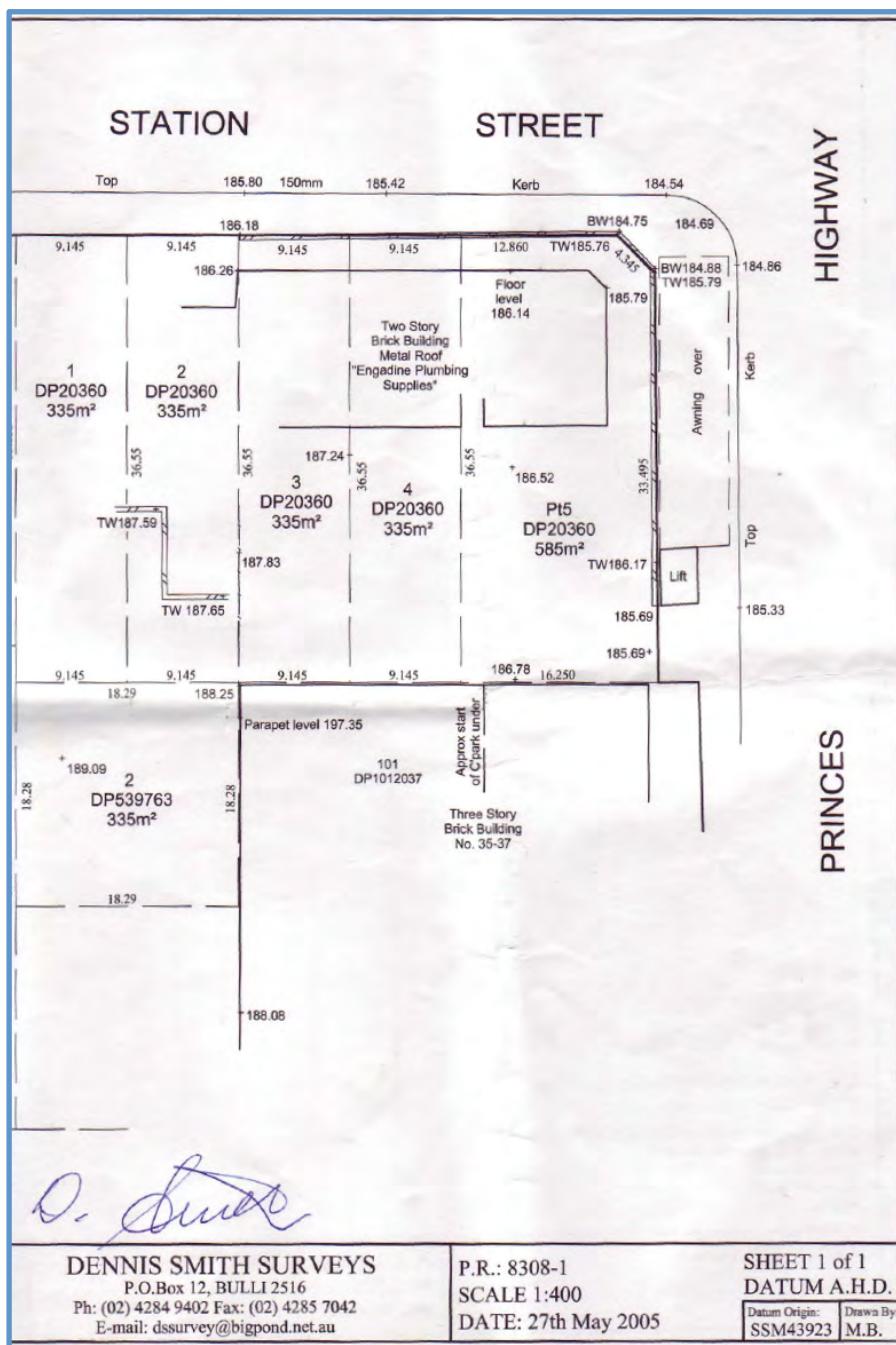

Figure 3 - Extract of Survey 27 May 2005

## 4 Engadine Town Centre

Engadine Town Centre is a great example of the activation of a village<sup>1</sup> by fine grain smaller shops and commercial premises within a generally inviting and well connected pedestrian environment.

It is nevertheless clear, through the exhibition of the Draft LEP, that the classification of Engadine as a village is challenged by virtue of the proposed B3 "Commercial Core" zoning.

This submission supports the proposed B3 zone. Engadine's Town Centre, serviced by the 4 major supermarket chains, a new Community Centre and recent medium density development including RFB and a new aged care facility (under construction) cannot be reasonably classified as a village.

Council is correct to seek to deliver job and dwelling targets through the promotion of the urban renewal of Engadine Town Centre as a Commercial Core.

Engadine is characterised by 2 large, inward looking, supermarket based shopping mall buildings (malls) sitting around the centre. The malls provide excellent parking in addition to the on-street parking in the Old Princes Highway, Caldara Avenue and Station Street. The malls promote fully compliant disabled pedestrian access to the fine grain smaller business environment of the main streets (Old Princes Highway and Station Street).

Council's large open hardstand parking to the Coles Supermarket in the western precinct of the Town Centre provides additional parking.

The juxtaposition of the two retail forms (malls and fine grain narrow shop fronts) demonstrates that they can work together, in an economic sense, to make a centre more vital, subject that accessibility and amenity are cleverly designed and controlled, for both vehicles and pedestrians.

Nevertheless, the large blank (inactivated-mean) walls of the large lots, coarse grain malls, with scant active street frontage in numerous locations, but for their limited entries, still result in dead, inactive, areas of streetscapes within Engadine.

The highly activated Old Princes Highway and Station Street footpaths, therefore remain the most important elements of the Town Centre.

The clever placement of the new community centre, town square and the relocation of the RSL war memorial within the same space, together with public parking and a new aged care facility now under construction, all contribute to the further activation of the public domain in Engadine, which has become the new vibrant town centre for Engadine.

Whilst it is observed that daytime activation is excellent, the lack of residential occupation, at sufficient density within the Town Centre, means that Engadine is not well activated of an evening.

---

<sup>1</sup> Engadine is defined as a Village in the South Subregion of Sydney under the NSW Government's Metropolitan Sub-Regional Strategy.

The introduction of shop top RFB housing above 1 or 2 storey retail and commercial uses (keeping fine grained and smaller strata occupancies at footpath level) will improve the activation of the Engadine Town Centre of evenings with the inherent CPTED benefits that follow from casual observation and such activation at street level and from new residential RFBs.

Field observations and mapping of grain size has demonstrated that some larger land holdings have successfully delivered fine grain results through the provision of small foot print strata retail premises at street level and strata commercial premises on their first floors. Unfortunately, with limited residential above they don't contribute to evening activation of the Engadine Town Centre. Night observations demonstrate that Engadine Town Centre is effectively dead once the malls close. Small restaurants rely upon demand created from the low-density areas around the town centre which then results in increase car use as the primary method of access.

The best outcome is to provide more residential development close to Engadine Railway Station and the bus interchange in Station Street, in new 7-9 storey mixed use developments. Fine grain commercial and retail spaces that are affordable are necessary to retain small business. To some extent, commercial and retail spaces can subsidised by uplifted yields in the residential components above.

FSR 2:1 presents little incentive to urban renewal within the Engadine Town Centre. The Council's Housing Strategy acknowledges few development have occurred in the Engadine Town Centre but proposes no change to FSR 2:1. Height is important but yields are very important, the yield that FSR creates must reflect the increased height and provide urban renewal incentives.

Pedestrian observations have demonstrated that the location of through site links within and from the malls are important. The links between Engadine Station, car parking (provided by the shopping mall developments and Council free parking) and the town centre activate the pedestrian environs. Sutherland Shire Council's choice to retain the Old Princes Highway, as a shared vehicle-pedestrian zone, rather than convert it to a pedestrian mall has delivered a vibrant result.

However, the footpath awnings are not contiguous. Pedestrian amenity can be improved by new developments ensuring that contiguous awnings service the full length of Station Street from the Railways Station to the intersection with the Old Princes Highway. This should be a specific DCP provision.

Accessibility to the fine grain core is primarily obtained from parking at the periphery via arcades and malls - through site links. The provision of higher density residential in the core of Engadine, serviced by a wide range of commercial and retail services as well as community services, is a desirable outcome that will reduce car use and promote better use of public transport.

## 4.1 Housing Strategy

Sutherland Shire Housing Strategy 2031 dated December 2012 articulates, as relevant to Engadine, that:

- Fewer multi-unit residential developments have occurred in Engadine centre than any other centre in the Shire.
- There has been an increase in single person households in Engadine. Engadine also showed an increase in families to 2011, as young families established themselves in the area.

This submission will not repeat the Housing Strategy's detailed observations but it purports that 2:1 cannot be achieved at current HOB. It is agreed that HOB should increase but a blanket 25m in Area 1 does not recognize the attributes of the subject site and additional HOB and FSR can be provided without any adverse impacts. On other sites HOB 25m will result in unsatisfactory overshadowing, this is especially the case having modeled 25m envelopes at a 2m podium setback (see Solar Analysis).

The Strategy states that:

"The centre has been the subject of an urban design and building shadow study, resulting in a building envelope plan which will inform a Development Control Plan."

The exhibited material does not provide the building shadow study. Our shadow modeling has demonstrated that higher heights are achievable for the subject site (HOB 30m at FSR 3:1) with no adverse amenity impacts (See: Part 9 Solar Analysis)

FSR to 3:1 (V) will not result in any additional overshadowing upon residential neighbours. The bulk of the overshadowing between 9am and 3pm falls upon the Roof of the existing 12m high commercial building to the south west and the Princes Highway.

This submission provides an urban design concept and shadow study demonstrating that the site is easily capable of 30m HOB and 3:1 FSR and can easily deliver SEPP 65 and RFDC amenity outcomes, whilst making a positive contribution to job and dwelling targets as a gateway site.

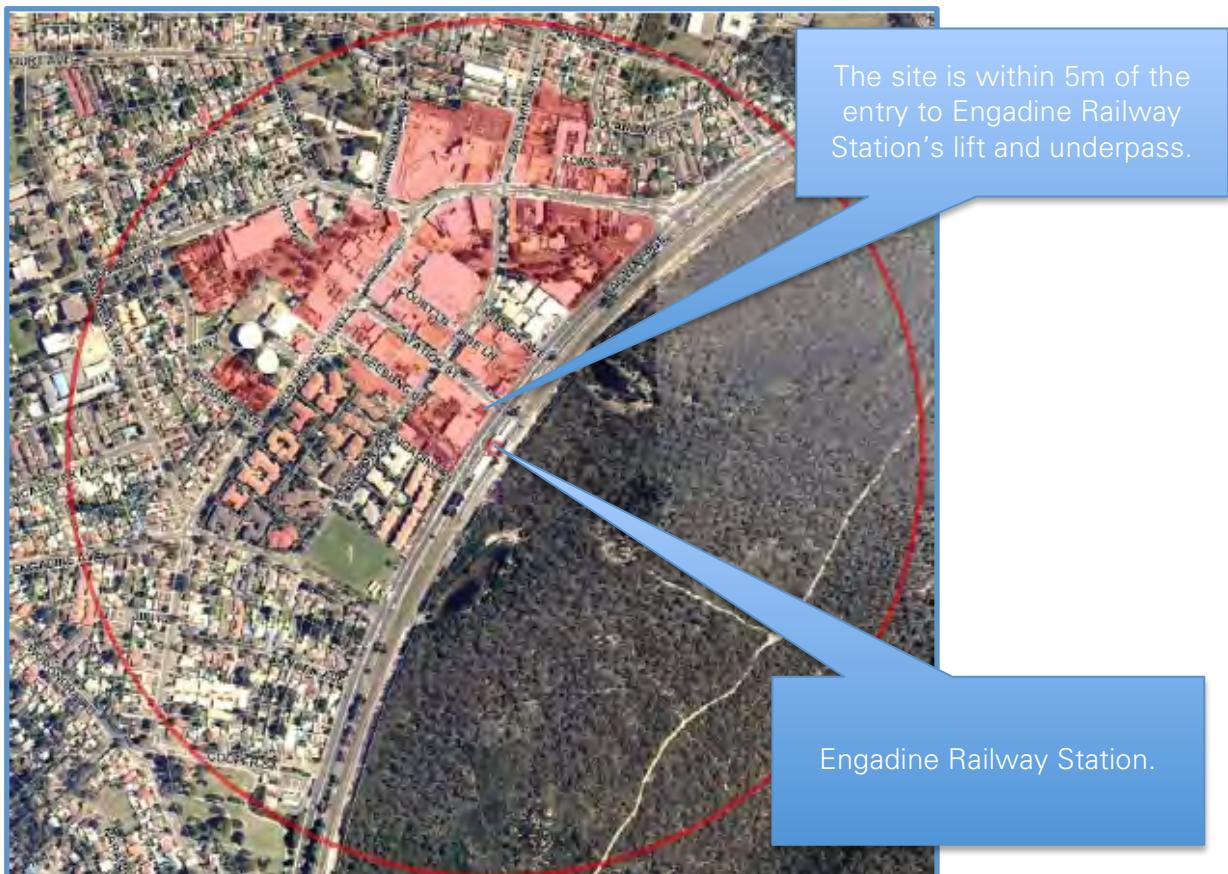

In the context of the housing strategy, the site;

1. is within the core commercial area (Area 1: Zone B3 (Centre zone transfer)) and we agree with the strategy, that it can be more intensively developed.
2. is within 5m of the underpass access to the railway station, is the closest site to Engadine Railway Station, a unique site, it has arguably the highest levels of DDA compliant accessibility to public transport in the Sutherland Shire at its front door,
3. is capable of compliance with SEPP 65 and the RFDC at HOB 30m and 3:1 FSR with high levels of articulation, solar access and cross ventilation through a narrow envelop depth as promoted by the Council.

4. should be block edge development presenting a strong definition of this gateway corner site (i.e. DCP provisions should not set upper levels back 2m as proposed by the housing strategy on this corner).
5. is capable of providing “one or two storeys of retail and commercial use, with upper levels of residential flats” (we have modeled 4m floor to floor for the ground and first floor levels).
6. will not whether at HOB 25m or 30m or FSR at 2:1 or 3:1 create any adverse overshadowing due to context, topography and orientation (See Shadow Analysis).
7. will reinforce Station Street as a core shopping area and defined this prominent gateway corner.
8. will achieve narrow (18m maximum) building forms (as modeled).
9. will maintain unfettered solar access to the footpaths suitable for outdoor dining.
10. will maintain a frontage supporting the functionality of the bus interchange in Station Street and the No Parking (pickup) zone on the Princes Highway.
11. maintain and improve pedestrian accessibility (note the site is not identified for the provision of any through site links but DA designs will consider the potential for through site links to the Council carpark off Nolan Place).
12. can provide a more appropriate gateway block edge urban form reinforcing the entry to Engadine at Engadine Railway Station and Station Street.
13. will activate the street frontage at the ground floor level through commercial/retail uses to enliven the street and give passive surveillance to the public area as well as provide better CPTED outcomes as a result of natural surveillance by higher density residential casual observation above.

It is noted that the Housing Strategy does not address the internal amenity benefits and the incentives to urban renewal that will result from increased HOB in terms of the views that may be attained.

In the case of the subject site the views that will be attained as the result of the site's relationship with the Royal National Park are unique to the Engadine Town Centre. For this reason the site can sustain additional HOB and FSR and this should be encouraged for the purposes of delivering better internal amenity outcomes in terms of views.

**Figure 4 - Engadine Centre Map 1 Housing Strategy – 800m Radius of Engadine Station**

## 4.2 Station Street's Character

Station Street is run down. It is clear that strategic planning must provide appropriate incentives to retain the smaller fine grain shops at street level whilst providing for increased mixed use residential and commercial above.

The Housing Strategy politely states:

“Engadine is a centre with a large residential catchment but limited development has occurred in recent years.”

Station Street is characterised by:

- An ill-defined entry from the Princes Highway (Railway Parade) to Station Street. (The entry to Station Street at the Princes Highway should be well defined by the tallest and strongest built form in Engadine) given its juxtaposition to the Princes Highway and Engadine Railway Station. It is a gateway site deserving of prominent urban form and density.
- Two large bus stops servicing the eastern and western ends of Station Street. The eastern bus stop in front of No.2 to No.14 Station Street services train departures and arrivals as well as adjoining suburbs.
- No driveway crossings with the exception of the entry/exit to the McDonald's carpark opposite No.2-No.14 Station Street and the exit from Engadine Tavern Drive-through Bottle-shop. Urban renewal should seek to eliminate all crossings within Station Street to improve the pedestrian environment.

- All commercial premises with the exception of Council's Youth Centre at No.16-18 Station Street, Engadine are serviced by rear lane or rear access.
- Built form is predominantly 1 & 2 Storey retail with commercial and limited residential above.
- A frontage typology that can be reasonably classified as Neutral or Dull. Station Street's frontages, facades and fenestration are run-down and only concerted urban renewal effort will result in an attractive and more activated streetscape.
- There is no shared zone or appropriate threshold treatment at the Princes Highway. A narrowed carriageway is provided with angled parking from the Old Princes Highway to Caldara Avenue promoting footpath café and restaurant uses.
- Street trees are very constrained and limited in numbers.
- Light poles are in a consistent theme and a noticeable element.
- Awnings are not contiguous thus pedestrians are exposed to the weather walking between the Railway Station and the buildings and parking in and around the Town Centre. Any new DCP should address the requirement for contiguous awnings to footpaths in Station Street, Caldarra Avenue and the Old Princes Highway.

## 5 Exhibited Draft LEP

The Draft LEP's effects are best summarised by the following extracts.

### Engadine

Table 1: Engadine	
	Engadine is a centre with a large residential catchment. Very limited development has occurred in the centre in recent years. The area provides an ideal opportunity for young families to find suitable homes at more affordable prices. There is strong demand for villas from an ageing population. Under the current zoning there is little opportunity for further development of flats in Engadine. More opportunities need to be provided for smaller households in order for the ageing population to downsize. Opportunities exist to increase the area zoned for flats and improve the design of ground floor flats for a more adaptable form of housing.
Area 1 Area zoned as Urban Centre	Area 2 Part of block bounded by Boronia Avenue, Old Princes Highway, and Waratah Road
	
Proposal Retain Urban Centre zone Increase residential component to 80%. Increase height	Allow 100% residential flats within existing Urban Centre zone. Increase height
Est. Additional Capacity 67 additional dwellings	138 additional dwellings
Height 25m (7-8st) (currently 3st)	20m (6st) (currently 3st)
Density FSR 2:1 (unchanged)	FSR 2:1 (unchanged)

### 5.1 Draft Zone

The Draft Zone is B3 Commercial Centre.

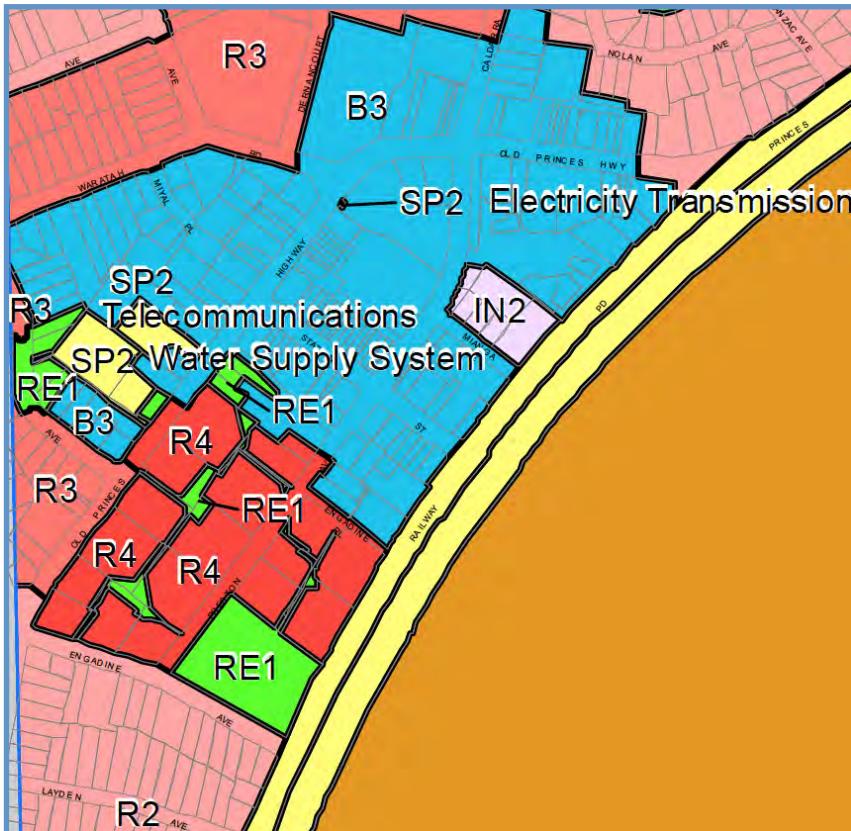

Figure 5 - Extract Draft LEP Zoning Map

## 5.2 Draft HOB

The Draft HOB is 25m.

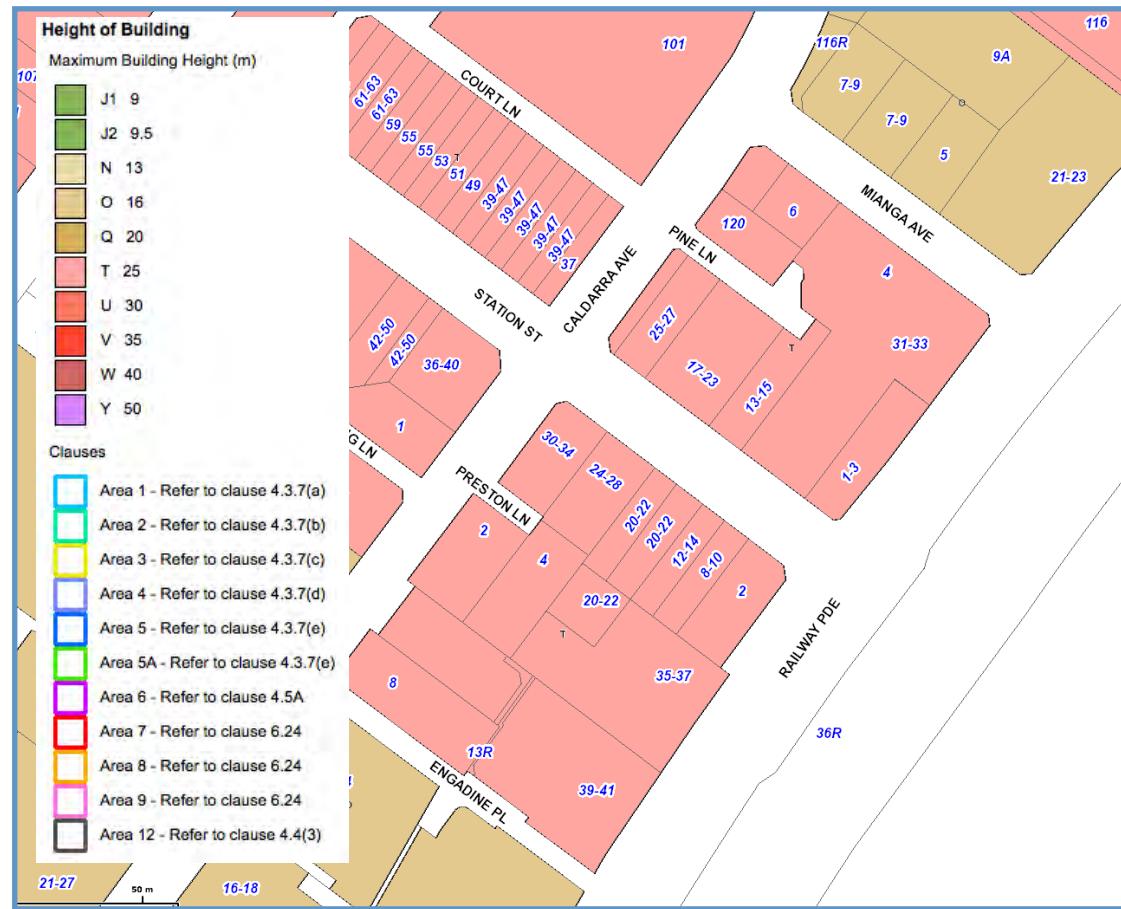

Figure 6 - Draft LEP HOB

### 5.3 Draft FSR

The Draft FSR is 2:1

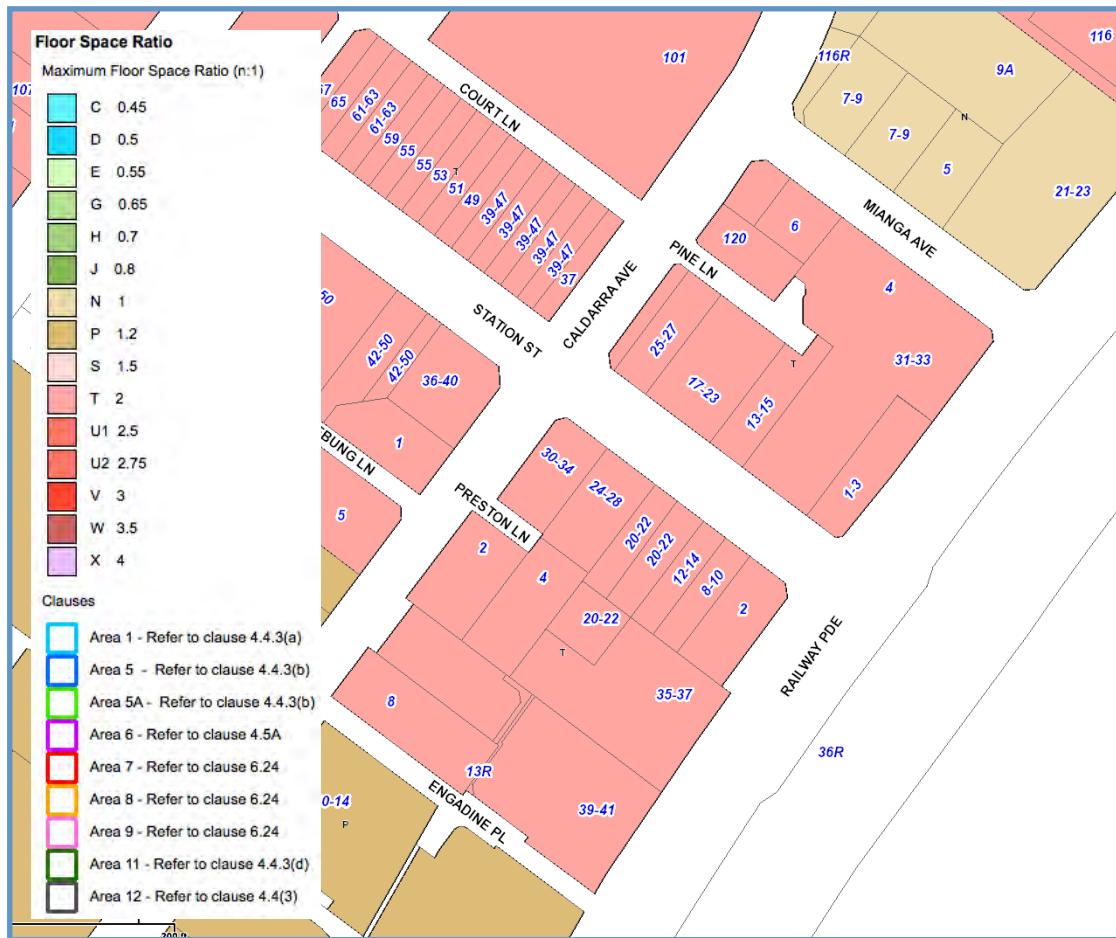

Figure 7 - Draft LEP FSR

Taking a fair but constructively critical approach to the draft LEP in this context increasing height without increasing FSR consistent with other proposed B3 zones will not encourage urban renewal and proper investment in quality urban design outcomes.

The one size fits all draft LEP HOB 25m and FSR 2:1 for the B3 zone does not acknowledge the specific potential of particular sites, including the need to provide some interesting diversity and reinforce the gateway entry points with stronger taller buildings, especially corner sites.

This is also relevant in the context of the identification of specific sites that can provide higher density outcomes with high accessibility and better amenity outcomes for neighbours and future occupants.

## 6 Comparison to other B3 Town Centres

The following table presents a summary of the HOB and FSR proposed across the Sutherland Shire's town centres by the Draft LEP.

What this demonstrates is, having regard to the ratio of HOB to FSR applied as well as maximums proposed that the Draft LEP, the Draft LEP is inconsistent in its application of HOB and FSR to Engadine.

Further, the Draft LEP sees every site in Engadine as the same. Sameness will not create a rich matrix of varied built form outcomes or leverage topography, orientation, accessibility, social and urban benefits that a more site specific approach will achieve.

It is clear, having regard to accepted urban design principals applied across not only the Sutherland Shire, but also many other town centres subject to changes under the Standard Instrument LEP process, that key urban planning features are:

- The identification and promotion of "Gateway" sites.
- Higher buildings and higher density closer to railway stations and classified roads.
- Higher buildings and higher density on corner sites with the encouragement of strong built forms to define and reinforce these corner sites.
- Higher and high density buildings in locations where due to neighbouring land use, topography, orientation, separation by roads, rail and reserves there will be no adverse amenity impacts upon neighbours and better environmental outcomes for future occupants.
- A range of heights and FSR that break up the urban form with different building forms having regard to specific site attributes.

The HOB and FSR applied in other centres demonstrate these principles have been adopted to a greater extent than for Engadine. A blanket HOB and FSR approach has been taken without regard to specific site attributes within Engadine Town Centre Area 1 and Area 2.

The Draft LEP presents an opportunity to achieve better outcomes in Engadine, more consistent with those that the Draft LEP supports in other centres.

Town Centre (B3) or Local Centre (B2)	Zone	Max HOB	Max FSR	Observations
Cronulla	B3	30m	3.0:1	The majority of the sites capable of supporting residential growth are within close proximity to the centre and with direct links to the railway station have been given 30m HOB and 3:1 FSR. The ratio of HOB 30m to FSR 3:1 is appropriate.
Caringbah	B3	40m	3.5:1	The majority of the sites have been

				given a HOB 25m and FSR 3:1. This is the correct and most appropriate ratio of HOB to FSR. Key sites very close to the railway station and bus interchange areas have been given higher HOB 40m and FSR 3.5:1. This centre exhibits a sensible approach in the identification sites that should be subject to increased HOB and FSR.
Miranda	B3	30m	3.5:1	The majority of the centre is dominated by Westfield but again key sites has been identified for 30m of HOB and 3.5:1 FSR.
Gymea	B2	20m	2:1	Gymea demonstrates a ratio between HOB (20m) and FSR (2:1) for the B2 zone. Applying this ratio to other centres that proposes 25m it is clear that an FSR of 2:1 is too low in other centres that can support an additional HOB. FSR 2:1 is appropriate for a village.
Kirrawee	B2	20m	2:1	Kirrawee demonstrates the appropriate ratio for a village HOB 20m to FSR 2:1, reinforcing that the B2 zones are treated as a local rather than commercial core town centre. Applying this ratio to other centres that proposes HOB 25m (T) it is clear that an FSR (T) of 2:1 is too low in other centres that can support increased HOB.
Sutherland	B3	40m	4:1	Sutherland has been afforded HOB and FSR outcomes more commensurate with a Major Centre. HOB 40m with a 4:1 demonstrate a general trend adopted by the Draft LEP i.e. 10m = 1:1, thus 20m = 2:1, 30m = 3:1 and in Sutherland's case 40m = 4:1.
Jannali	B2	20m	2:1	Jannali demonstrates consistent with Gymea and Kirrawee that the appropriate built form outcomes are well represented by HOB 20m and FSR 2:1. This reinforces that if HOB is increased above 20m that FSR should also increase as a ratio.
Engadine	B3	25m	2:1	Engadine is an anomaly inconsistent with the other centres proposed to be zoned B3 whilst it has been given a HOB that is predominantly 25m (T) less than other maximums in the B3 Zone, its maximum FSR is 2:1 is low

				and akin to a Village rather than befitting of a Commercial Core.
Heathcote	B2	13m	2:1	Heathcote is a small village not a town centre. This village has create furture potential and incentive for new development at this time should be kept low allowing further HOB and FSR at a later date.

## 7 Proposed Yields

The site has a total area of 1,255m<sup>2</sup>. This submission proposes an FSR is 3:1. Total GFA would be 3,765m<sup>2</sup>.

The commercial Ground floor may occupy 1,000m<sup>2</sup> with no landscape area requirements proposed by the Draft LEP, leaving 2,765m<sup>2</sup> GFA for residential above.

As block modeled in figures in this submission the Floor Area inside the external walls is 8,800m<sup>2</sup>. So we are clear the bulk as block modeled, an envelop, is not the bulk that would be finally achieved at the FSR 3:1 as proposed by this submission.

Allowing up to 8 residential Storeys, GFA per level would equate to (2,765m<sup>2</sup> / 8 = 345m<sup>2</sup>). This equates, at an average unit size of 80m<sup>2</sup>, in approximately 35 units.

Allowing for the definition of GFA in the Standard Instrument LEP one might add 5% to include external walls and vertical circulation. Thus the final foot print above the podium level may be reasonably calculated at 363m<sup>2</sup>.

Allowing 5% for the definition of GFA in the Standard Instrument LEP, NBA above podium would be (2,765 x 1.05) = 2,903m<sup>2</sup>.

Reducing these calculation back to the block modeling in this report, a HOB 30m and FSR 3:1 compliant building would only occupy approximately 40% of the envelop volume as block modeled.

This demonstrates that applying an FSR of 3:1 to the HOB 30m will promote a well articulated and SEPP 65/RFDC compliant built form outcome consistent with the relationship between HOB and FSR for other B3 zones in the Sutherland Shire.

In simple terms the yields proposed are not excessive in the context of a B3 zone and allow for excellent setbacks and articulation.

## 8 Accessibility

This part of the submission reinforces the site's proximity to Engadine Railway Station and the Princes Highway as well as bus services, all available from the door steps of the subject site.

### 8.1 Railway

Engadine railway station is located on the CityRail Illawarra line. It consists of two side platforms with an overhead footbridge, the station building and ticket office is located on the *up* (city bound) platform.

A subway connects the station with the western side of the adjacent Princes Highway. The station was extensively upgraded in 2006 with the provision of extended shelters and passenger lifts between the platforms and the overhead footbridge providing DDA compliant access for people with disabilities to both

platforms. A further lift is located on the foot adjoining the subject site providing disabled access to the pedestrian subway.

The subject site has arguably the best direct access of any site in the Sutherland Shire to a railway station from within a town centre given the near level topography of Station Street and the 2006 upgrading of disabled access, located within 5m of the subject site.

Depending upon the train service offered, it take approximately 45 minutes from Engadine Station to Central Station, 33 minutes to the airport connection at Wollie Creek, 23 Minutes to Hurstville and 8 minute to Sutherland. Direct access to Bondi Junction without changing services takes 59 minutes. Services are provided at 22-25 minute service intervals.

## **8.2 Buses**

Veolia Transport runs four routes via Engadine station's bus interchange in front of the subject site:

- 991 - between Sutherland and Heathcote
- 992 - to Miranda
- 993 – to Woronora Heights
- 996 - to Heathcote East

Future residents of the subject site have high frequency public bus services at their front door.

## **8.3 Taxi**

Station Street is serviced by the only permanent taxi rank in Engadine. The Taxi Rank is 60m west of the subject site.

## **8.4 Vehicular Access**

The site is services by driveway access from the Princes Highway. There is significant potential for negotiated rear access to the site from Preston Lane servicing Council's youth centre and private carparks south-west and to the rear of the site.

The site is 1.4km from the intersection of the Heathcote Road providing access to the M5 and M7 motorways west and direct connection to Wollongong and the south coast.

Vehicular access to the Royal National Park is available at Farnell Avenue 3.7km north on the Princes Highway and at McKell Avenue 8.8km south on the Princes Highway. The Royal National Park provides a wide range of recreational activities.

## 9 Solar Analysis

The following solar analysis demonstrates that increasing the HOB to 30m (U) and FSR to 3:1 (V) will not result in any additional overshadowing upon residential neighbours. The bulk of the overshadowing between 9am and 3pm falls upon the Roof of the existing 12m high commercial building to the south west and the Princes Highway.

There is no overshadowing of Station Street between sunrise and 3:40pm mid-winter and between 3:40pm and sunset the only shadows only fall upon the road.

This block modeling, which creates a bulk with an FSR of approximtely 8:1, has been based upon a block edge development envelop reinforcing the corner site and a maximum 18m depth consistent with SEPP 65 and the RFDC design requirements.

The extent of shadowing modeled would be extreme as such impacts will never generated by a real development complying with a 3:1 FSR. A FSR 3:1 complying development would only occupy approximately 40% of the volume modeled below.

In reality, at an FSR of 3:1 as proposed, the shadowing impacts would be significantly less than demonstrated by the block modeling below.

The modeling below in the context of the existing commercial building's impacts and setting aside the potential impacts of a HOB 25m as proposed by the Draft LEP, are considered negligible. In fact there will be no additional shadowing of any neighbours from 10am mid-winter (See Figure 9 - Mid-Winter 10am Shadow at 30m HOB).

Therefore, whether at HOB 30m FSR 3:1 or even higher HOB and FSR, the site does not create any significantly different outcomes in terms of overshadowing. Overshadowing is negligible due to site orientation, the existing 12m neighbouring commercial building and its juxtaposition to the Princes Highway south and south-east of the site.

The site is not constrained in terms of HOB and FSR in the context of overshadowing impacts and could easily sustained even more HOB and FSR than this submission seeks, with no adverse amenity impacts.

In terms of the sites ability to improve the microclimate and solar performance within the development as SEPP 65 and the RFDC require, the envelop modeled demonstrates that orientation maximizes north facing walls. The southern wing receives both eastern and western sun other than for the reentrant internal corner. This issue can be adequately addressed through clever architectural design in compliance with the proposed 3:1 FSR under SEPP 65 and the RFDC.

The most solar deprived areas of the site will be commercial occupancies at the ground and possibly if demand exists 1<sup>st</sup> floor levels.

## 9.1 9am 20 June Shadow

The 9am shadow falls predominantly upon the roofs of the existing 3 storey (12m) commercial development south west of the site and the roof of the RFB further south west fronting the Princes Highway.

In the short to medium term it is unlikely that the 3 storey commercial building will not be redeveloped and it has been shown at its existing HOB, not at the 25m HOB proposed by the LEP. Even at 12m HOB the existing commercial building at 9am overshadows the north-eastern elevation of the RFB toits south-west. At 9am the HOB 30m as proposed by this submission will have not impact upon openings in the north-east elevation of any adjoining RFB.

Figure 8 - Mid-winter 9am Shadow at 30m HOB

## 9.2 10am 20 June Shadow

The 10am shadow analysis has been included to demonstrate that by 10am, the site at HOB 30m, would not have any shadowing impacts upon the RFB south-west of the site.

By 10am mid-winter the shadow from a 30m element (southern wing) of the site at a zero lot boundary setback, would fall upon the concrete roof of the existing 3 storey commercial building to its south-west.

Again it must be reinforced that a zero lot boundary setback in this location is highly unlikely at FSR 3:1 and a SEPP 65 – RFDC separation outcomes will provide setbacks details at the DA stage.

Figure 9 - Mid-Winter 10am Shadow at 30m HOB

### 9.3 12 Noon 20 June Shadow

The corner of the site is orientated to the east and the noon shadow can be seen to fall from the corner directly south across the Princes Highway. At noon midwinter, the western extent of the shadow falls across a small portion of the roof of the adjoining 3 storey (12m) commercial building and then across the Princes Highway.

It can also be seen that the impediment to solar access to the RFB further south-west is the existing 3 storey commercial building.

The increase in HOB from 25m to 30m as proposed by this submission has no adverse environmental or amenity impacts.

Figure 10 - Mid-Winter Noon Shadow at 30m HOB

## 9.5 3pm 20 June Shadow

At 3pm the difference between a 25m and 30m HOB shadow are insignificant. The shadow falls to the south-east across the Princes Highway with no adverse environmental or amenity impacts noting that the structures within the Railway Station also overshadow the main platform.

Figure 11 – Mid-Winter 3pm Shadow at 30m HOB

## 9.6 9am 20 June – Station Street Footpath

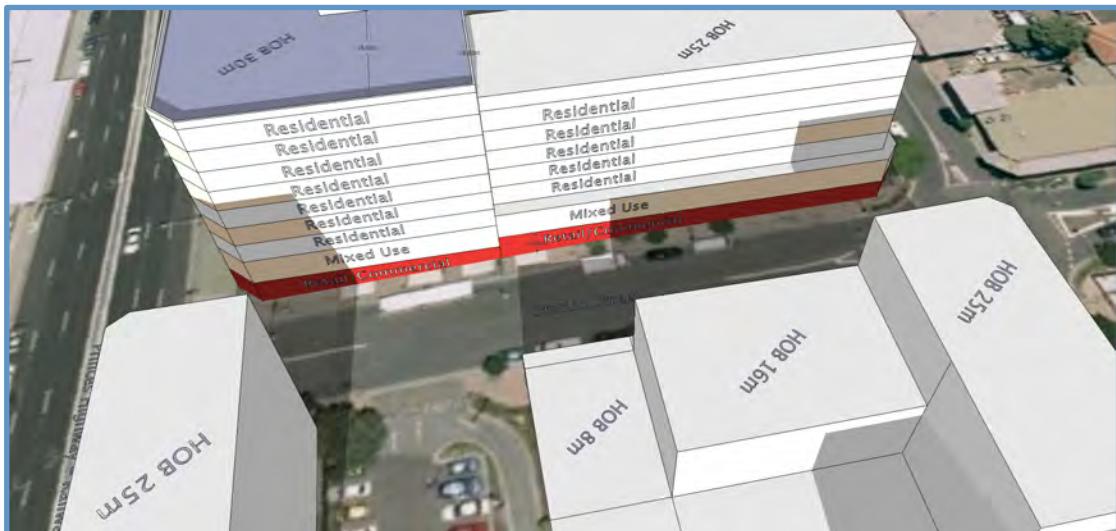

Figure 12 - Station Street Shadow 9am

## 9.7 10am 20 June - Station Street Footpath

Figure 13 - Station Street Shadow 10am

## 9.8 11am 20 June - Station Street Footpath

Figure 14 - Station Street Shadow 11am

## 9.9 12 Noon 20 June – Station Street Footpath

Figure 15 - Station Street Shadow 12 Noon

## 9.10 Summary of Solar Analysis

The subject site at HOB 30m and FSR 3:1 will not have any adverse overshadowing impacts as it's juxtaposition to neighbours, existing land uses and the Princess Highway (where the majority of shadowing will occur). It will have no impact upon any residential premises.

Applying HOB 25m to the northern side of Station Street as shown in the Station Street Footpath analysis (clause 9.6 to 9.9 above) demonstrates that at HOB 25m buildings would cast shadows upon the north facing elevations and footpaths in Station Street in mid winter. That is buildings opposite the subject site.

Council's stated strategic objective that the LEP should seek to preserve solar access to Station Street's north facing footpaths will not be achievable at HOB 25m with 2m setbacks as proposed. It must be acknowledged however, that the block modeling provided and the bulk demonstrated at HOB 25m will not result in the extent of over shadowing demonstrated, as any development will be further constrained by FSR.

Ultimately detailed design modeling would demonstrate low levels of shadowing but careful design is still required at the DA stage to ensure that the objective of providing solar access to north facing footpaths is achieved by building proposed on the northern side of Station Street by increased setbacks to the street alignment.

Simply, the subject site can sustain HOB 30m and FSR 3:1 whereas any increase in HOB and FSR along the northern side of Station Street will result in overshadowing of the north facing elevations and footpaths.

## 10 SEPP 65 and RFDC

The site will easily comply with SEPP 65 and RFDC requirements, due to the site orientation, topographical position, separation provided by Station Street.

The Station Street frontage is north-east facing. The Princes Highway Units whilst facing south-east have rear north-west aspects for solar access and are sheltered from traffic noise.

The modeled envelop, with a maximum 18m depth demonstrates that the building would be very well articulated within the envelop at an FSR of 3:1. A complying 3:1 FSR would only fill 40% of the volume of this modeled envelop and less if the ground floor commercial occupied 100% of the foot print with a podium common open space area.

The modeling has adopted 4m floor to floor for two levels of commercial/retail and 3m floor to floor for residential levels allowing 9 levels with a 1m parapet. This demonstrates that internal amenity in terms of ceiling heights are easily achievable in creating a maximum 9 storey building. The requirements of the Building Code of Australia will necessitate two vertical cores which will also improve RFDC outcomes.

There also exists great potential for roof top common open space area(s) taking advantage of the amenity provided by views that will extend from the Blue Mountains to Sydney, to the Pacific Ocean and south over the Royal National Park. All units above level 3 will enjoy panoramic views and views from the top level will be spectacular adding to the amenity outcomes for future occupants. The 1m parapet as modeled will provide adequate balustrading for such as design if necessary.

The HOB 30m allows a BCA effective height of 25m delivering a more sustainable development with more passive and less active systems required. As such it will provide sustainable housing in social and environmental terms, a long-term asset to its neighbourhood. The site at HOB 30m and FSR 3:1 can achieve urban planning policies for its regional and in a local context, better built form and aesthetics addressing a prominent corner, streetscape and the public space it will define.

The site can better satisfy the increasing demand, the changing social and demographic profile of the community, and the needs of the widest range of people from childhood to old age, including those with disabilities (specifically identified by the Council's Housing Strategy).

The site can maximise amenity, safety and security for the benefit of its occupants and the wider community with its activation of the footpaths, new awnings and better natural surveillance.

The site can minimise the consumption of energy from non-renewable resources, to conserve the environment and to reduce greenhouse gas emissions through full compliance with both SEPP 65 and BASIX. The single biggest contribution to greenhouse gas reduction being is juxtaposition to Engadine Railway Station, bus services and commercial and retail services promoting low car use.

## 11 Conclusion

This submission support the proposed B3 Commercial Core Zone for the Engadine Town Centre including the subject site.

The subject site can easily sustain HOB of 30m and FSR of 3:1 with no adverse environmental impacts, better amenity outcomes whilst achieving job and dwelling targets together with the highest levels of accessibility to public transport.

The analysis of the relationship between HOB and FSR in the Draft LEP demonstrates a logic, i.e. (HOB 10m = FSR 1:1).

Maximum heights and FSR can be summarized as;

- Local Centre HOB 20m = FSR 2:1,
- Commercial Core HOB 30m = FSR 3:1
- Sutherland Town Centre 40m = 4:1.

Key sites in Engadine, including the subject site, should be targeted for HOB 30m and FSR 3:1.

The following Draft LEP objectives as relevant are specifically achieved by this submission:

- Clause 1.2(2), (a), (b), (c), (e), (f), and (j)
- Landuse Table Zone B3 all objectives.

The specific site attributes that support this submission are;

- 5m from disabled access entry to Engadine Railway Station
- frontage to bus interchange serving Engadine Railway Station
- accessibility to taxi rank and Princes Highway
- prominent gateway corner site deserving of a strong urban form outcome
- no neighbouring residential buildings over looked or overshadowed
- easy compliance with SEPP 65 and RFDC available
- consistent with HOB to FSR ratios for similar sites in other B3 zones
- excellent CPTED outcomes

These are compelling strategic planning arguments for creating more residential units on this site, but the most compelling is the sites juxtaposition to Engadine Railway Station and its ability to maximize public transport usage with no amenity impacts upon anyone and to create high levels of internal amenity.
