- Protections for marine mammals

Comment

I strongly believe in preservation of our ecology in the way it was intended by nature. Human interference in trying to control populations of various native species only results in harming this species and any other species of flora and fauna that depend on them. Nature will self-regulate the numbers if we let it. We need to maintain healthy populations of dingos, the only native land predator in order to control the numbers of kangaroo. They will do it the right way, only hunting sick and weak animals, which improves the genetics of kangaroo and prevents disease in those animals. As we are now aware that viruses can mutate and cross from animals to human population. Therefore, leaving the nature regulate the healthy numbers of all species the natural way to prevent/reduce the danger of new diseases is paramount. Culling healthy strong animals is very harmful to the overall ecological health.
