Comments: i am concerned that the mine will be only 500 metres from the banks of the Mitchell river and that it requires 3 billion litres of water to operate per year. what will happen to the agricultural industry further down stream and how will they keep the radioactive toxic dust particles from releasing into the atmosphere and contaminating everything in its wake. we have already had water restrictions placed upon us during summer months and there is no place for such said mine to be taking billions of litres from this most important resource.
