Comments: Proposed Fingerboards Mineral Sands Mine. Please find below my reasons for opposing this proposed mine. Kalbar Operations Pty Ltd, a new company with no experience operating a mine is proposing a massive open-cut mineral sands mine at the Fingerboards, 20km NW of Bairnsdale in East Gippsland. 13 square kms on a plateau which is above the Mitchell River and the vegetable fields of the Mitchell River Valley is to be mined up to 45m deep. Kalbar's geochemistry report lists a number of radioactive and cancer-causing substances that will be present in the dust generated. The \$155M/year Mitchell River Valley vegetable industry that employs up to 2,000 people is as close as 500m downwind from the mine. The Mitchell River, the source of water to irrigate those vegetables and make ice to transport them is 350m downwind (between the mine and the vegetable fields). Kalbar needs over 3 billion litres of water annually for processing and dust suppression for 15 years. This shows how much water is needed to control the dust which will potentially pose major human and animal health risks. Kalbar's high need for water could lead to earlier and tighter restrictions on users reliant on water from the Mitchell River (such as the horticulture industry) and is likely to impact the health of the Gippsland Lakes from reduced fresh water. There are concerns that jobs in tourism and agriculture are at risk from potential contamination of the river and crops. Could other jobs be created instead? Based on irrigation data, if the 3 billion litres of water Kalbar requires annually was redirected to growing vegetables, 3 times more jobs could be created than Kalbar's proposal. These would be long-term sustainable jobs to grow food. According to National Farmers Federation statistics, every job created in agriculture leads to 4.2 indirect jobs. From Kalbar's website, 1 mining job leads to 1 indirect job. This proposed mine is considered to be in a highly inappropriate and dangerous location, threatening our food, water, health and already reduced river flows. Given that more extreme winds (dust dispersal) and possibly diminishing rainfall may place even greater demands on the the Mitchell river system because of "Climate Change" we need to safeguard the valuable existing food production activity in this area. Thanking You, David De Bondi
