

RESERVOIR LEVEL CROSSING

WHAT ARE THE DESIGN OPTIONS?

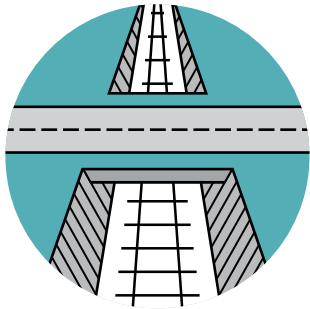

We have investigated a number of design solutions for removing the level crossing at Reservoir and narrowed this down to two options. We would like your feedback on these designs.

Raising the rail over the road

What is it?

This option would involve a rail bridge over High Street. The bridge would be around nine metres high and approximately 1km long, with new station platforms above ground.

Lowering the rail under the road

What is it?

This option would lower the train line into an open trench under High Street. The trench would be around 1.3km long, with new station platforms below ground level.

We want this project to revitalise the central heart of Reservoir. Each of the design options still on the table is a unique opportunity to deliver the kinds of benefits you told us you wanted.
