

How to create HiRes Print-ready PDFs in Canva

1. Check document has **3mm bleed** added in settings & elements that bleed should be dragged to the outer guide.

2. Check all images used are **HiRes (at least 300 dpi)**

3. When complete click **Download**

4. Select **PDF print**
Best for Printing

5. Select **Crop Marks and Bleed** and **Flatten PDF**

6. Select **CMYK**
(best for professional printing)

7. Select **Download**

NB: All Photoshop images used should ideally be **300dpi CMYK** (not RGB), using RGB images can result in unexpected colour variances. If you have specific colour requirements we recommend asking for a **printed proof** prior to printing to ensure the final printed colour meets your expectations.
