

LAKER

Laker is a venture by two friends,
David Caon and Henry Wilson.
An exploration into functional objects
for the home or workplace with design
undertaken as a series of discussions
about how we live.

Continental Shelf	pp. 3 - 8

TBD Chair	pp. 14 - 16
Keel Table	pp. 17 - 19

Continental Shelf

A modular shelving system, consisting of a number of components designed to be attached to a slotted metal rail. Available in a dark and light colorway and mounted directly to the wall or via solid timber beams.

The Dry Bar module brings luxury to the Continental system. The perfect place to store spirits, wine and glassware via an adjustable internal shelving layout. Featuring a deploying mirrored work shelf for preparing drinks.

Worktones Installation The continental shelf is available with an ever expanding range of accessories. Here the retail hanging shelf component is utilised to create a configuration fit for retail purposes. Ease of reconfiguration means that the Continental system can change or grow in line with customers requirements and equally suit both residential and commercial applications.

A-Joint

This multi-use joinery system unites timber in numerous configurations resulting in a sturdy A-frame structure. A sub-frame beneath the table surface secures the tabletop and the A-Joint locks the sub-frame and legs into one complete form.

Brass A-Joint The A-Joint is available in various materials and finishes. Here the brass joint is shown with solid Walnut top and legs. Depending on material selection, the A-joint table can suit different scenarios and settings whilst preserving its pure, archetypal design language.

The A-joint system comprises a range of joints suited to create diverse products beyond the table. The A-3 joint in regular and mini scale accommodate the construction of round tables and benches.

Rake Stacking Chair

The Rake Stacking Chair is an expression in simplicity, functionalism and restrained elegance. Its design focuses on the essentials of materiality, geometry and scale. Careful consideration has been given to the human form in achieving a balance between comfort and the piece's final dimensions.

Keel Table

A flat-packed table prototype currently in development, the Keel table explores the state of material. A keel, inspired by vintage racing yachts, is pushed through the top of the table and forces open the sandwiched plywood legs. Thus the assembled table remains in a constant state of tension until such a time as it is disassembled. The hollowness of the legs allow for cable management making Keel table equally viable as a desk or dining table.
