## SURGICAL REPORT

**Re: Glenledi Fox**  
**Brand:** 190090  
**Description:** Bay Standardbred filly  
**Owner:** Peter Grant

On 23 June 2020 the above-described weanling underwent general anaesthesia for placement of bilateral lateral transphyseal screws in the distal radial physes for treatment of bilateral carpal varus. The skin incisions were closed routinely. The weanling recovered without incident.

### Management/follow-up:

1. Rest: please maintain the weanling on small yard rest (20m x 20m) until screw removal.
2. Suture removal: 3 July 2020.
3. Bandage changes: please change the bandages every 4 days until suture removal.
4. Screw removal: The screws should be removed when the carpal varus is corrected. It is not unexpected for the limbs to correct at different rates and the screws to need removal at different times.

Intravenous injections have been administered to this foal. Please monitor the catheter and injection sites closely. Please contact Rangiora Veterinary Centre if there are any signs of heat, pain, swelling and/or discharge.
